KSN/HD/Softsynchro®
Holders with minimum length compensation

Technical description

On many modern CNC machining centres the rotation of the spindle can be synchronized with the feed axis. This makes it possible to produce threads with tool holders without length compensation. However, practical experience shows that even with this kind of "rigid tapping", synchronization errors can come up.

Possible causes are:

- machine dynamics, harmonization of spindle and linear drives, especially during the moment of changing the rotation direction
- tolerances on the threading tool

When rigid tool holders are used, these errors can lead to problems. High axial forces come into play, and can have serious negative consequences on the production process, such as:

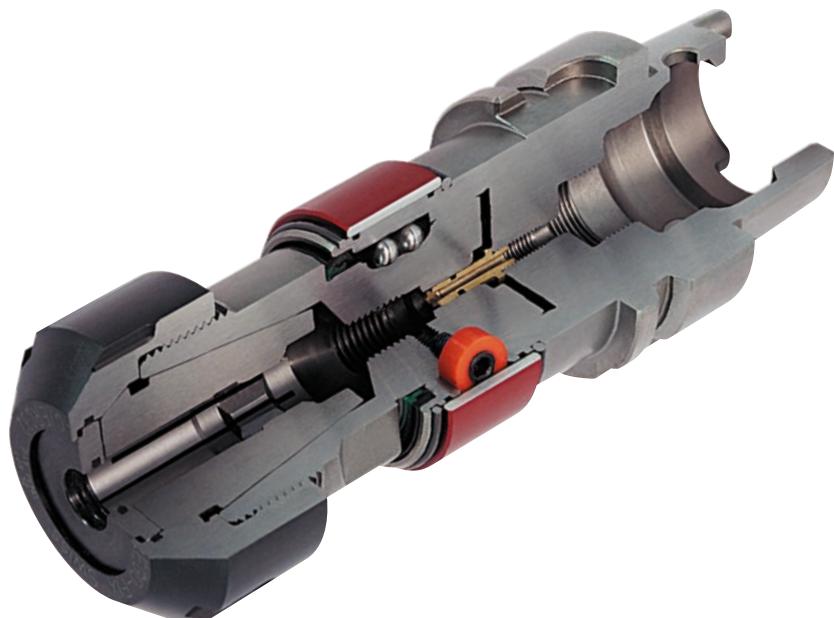

- reduced tool life, caused by high one-sided flank friction on the threading tool
- unclean thread flanks on the workpiece
- threads not true-to-gauge

EMUGE collet holders type KSN/HD/Softsynchro®

- serve as absorbing link between synchronous spindle and tap / cold-forming tap, and compensate pitch differences between threading tool and synchronous spindle
- provide the high concentricity of a rigid tool holder
- guarantee safe clamping of taps / cold-forming taps by collets with square drive
- do not necessitate tools with special shanks
- guarantee process safety in the synchronous production of threads
- clearance in the tooth flanks in the driven tool holder
- clearance in the drive between driven tool holder and machine drive

Constructional details

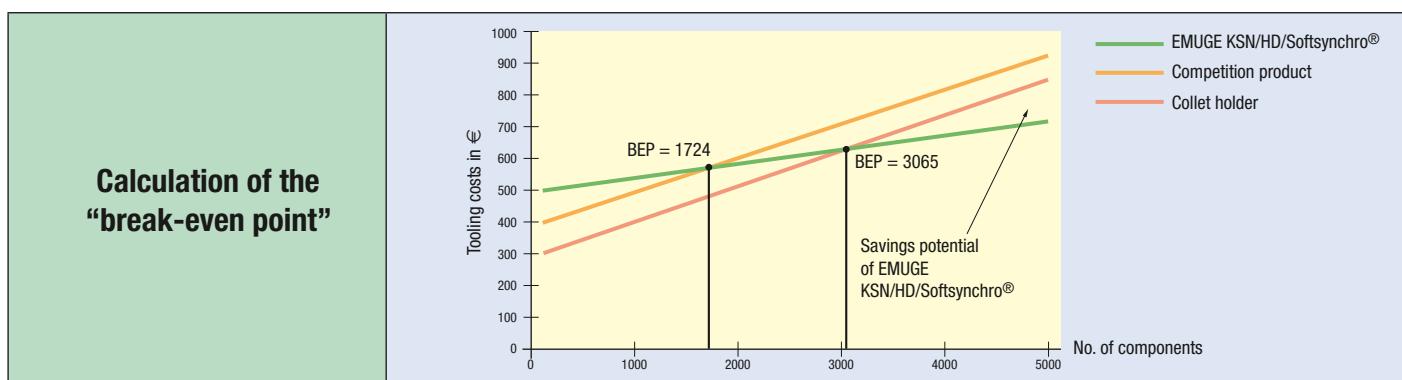

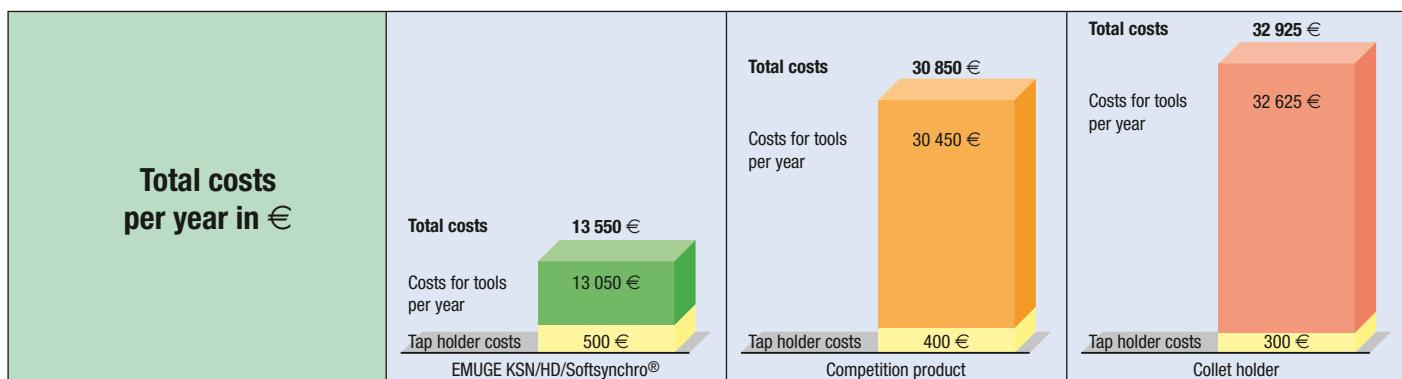

- made of two pieces (holder shank / tool seat)
 - easy to disassemble
 - allowing trouble-free maintenance
- axial force compensation and torque are separated
 - hardly any influence of torque on axial force compensation
- absorption elements made of plastic
 - no influence on the cutting edge of the tool through axial vibration during work
- pre-tensioning of absorption elements
 - allowing axial movement only after the pre-tensioning force is exceeded
- axial movement guided by balls
 - reduced friction (rolling friction), and consequently extra short reaction times
- suitable for up to 50 bar internal coolant pressure
 - no effect on axial force from coolant pressure, consequently no axial movement

Economical efficiency calculation

Practical application

Many tests regarding this topic have been made with taps and cold-forming taps. Depending on the individual case, our customers were able to increase their tool life by up to 150%. In the following diagrams, you will find the axial forces which come into play in the cold-forming of an M10 thread in St37. We have traced the axial forces at two different speeds, 500 min⁻¹ and 2000 min⁻¹.

The following collet holders were tested:

- a) rigid synchronous collet holder
- b) EMUGE collet holder type KSN/HD/Softsynchro® size 01, with minimum length compensation on tension and compression
- c) synchronous collet holder of a competitor with minimum length compensation with axial absorption

All tested collet holders were used with a collet type ER20-GB, i.e. with integrated square.

The following results were verified in these tests:

- axial forces increase with the raise of speed
- the forces which come into play in the cold-forming of threads are considerably higher with a rigid collet holder than with an EMUGE collet holder type KSN/HD/Softsynchro®
- the competition collet holder can absorb the upcoming forces only lightly, in comparison with the rigid collet holder

Conclusion

The EMUGE collet holder type KSN/HD/Softsynchro® makes the optimum use of a synchronous spindle possible, with the best imaginable tool life and thread surface quality.

What ist the reason for the excellent axial force characteristics of the EMUGE collet holders KSN/HD/Softsynchro® with minimum length compensation?

The most important feature is the patented constructional separation of the transmission of torque and axial force.

Other construction characteristics of the EMUGE collet holders KSN/HD/Softsynchro® include:

- freedom from play of the tap holder in the C-axis due to form-positive torque transmission by means of steel balls
- soft activation of the pre-tensioned minimum length compensation after exceeding the constructionally specified guide force by almost loss-free rolling friction of the torque transmission balls in their ball grooves
- minimum length compensation and axial force transmission by means of pre-tensioned elastomer springs
- elastomer springs which, by means of their absorption characteristics, prevent oscillation of the tool cutting edge

If the separation of the transmission of axial force and torque is not realised, then an axial error will be generated from the first stage of the thread production – this can be seen clearly on the competition holder. The logical consequence is – as can be seen in the diagrams – an immediate dramatic increase of axial force. This effect is prevented by an intelligent, practice-oriented construction of the collet holders like that of the KSN/HD/Softsynchro® holders.

With machine tools which do not offer the possibility of synchronous thread production, it is necessary to work with a more generous length compensation than the minimum length compensation of the KSN/HD/Softsynchro® collet holders.

For such applications, EMUGE offers collet holders with length compensation and internal coolant-lubricant supply, type KSN/HD/ER; these holders combine the advantages of clamping the threading tool in a collet with those of a classical length compensation holder.

On the following pages you will find an introduction to the KSN/HD/Softsynchro® collet holders which will help you to achieve machining results that leave nothing to be desired where accuracy and tool life are concerned.

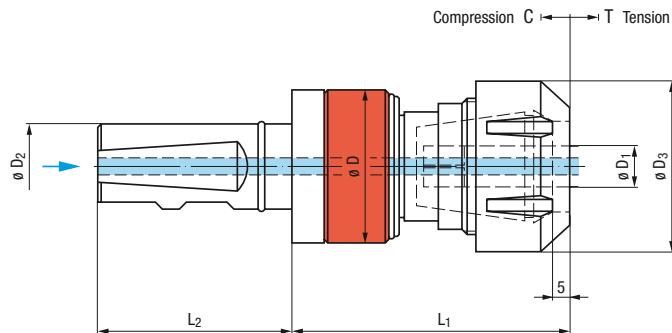

The KSN/HD/Softsynchro® series is available in the following designs:

- collet holders for collets type ER-GB with internal coolant-lubricant supply
- collet holders for collets type ER-GB with minimum-quantity lubrication (MQL or MMS)
- collet holders for collets type PGR-GB with internal coolant-lubricant supply
- collet holders for driven tools made by heimatec®, W&F and mimatic® – holders for other manufacturers available upon request

In addition to the standard designs of collet holders listed above, special solutions are available upon request for wet and minimum-quantity lubrication.

- Clamping nut for sealing discs is included in the delivery
- Wrenches for tightening the clamping nut and for counter-holding are available as assembly sets (see page 19), please order separately
- Collets and sealing discs (see pages 18-22), please order separately
- Square seat for tools with shank diameter 9 and 10 mm is integrated in the tap holder body
- For checking the torque values on the clamping nuts, we recommend using torque wrenches type TORCO-FIX (see page 24)
- Further designs available upon request

Assembly of collet and tool

1. Insert collet into the clamping nut.
2. Tilt collet.
The groove of the collet must engage in the eccentric ring of the clamping nut at the marked position.
Tilt collet in opposite direction until it clearly engages.
Collet is flush with the clamping nut or the sealing disc.

3. Screw the engaged collet with the clamping nut manually onto the thread of the holder.

Important: Only mount clamping nuts with correctly engaged collet!

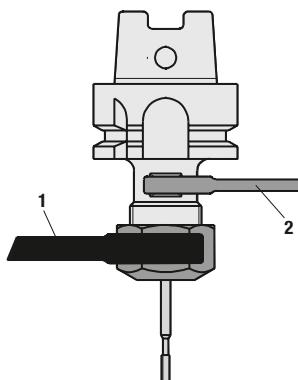

4. Insert tool.

Important: If collet and tap are provided with a square, the tap must be brought into such a position that it can be pushed into the square seat of the collet.

5. Tighten the clamping nut with the wrench.

Observe the max. torque values in the table.

Type	Max. tightening torque
	(Nm)
Hi-Q/ERM 11	15
Hi-Q/ERMC 11	15
Hi-Q/ERC 16	50
Hi-Q/ERC 20	40
Hi-Q/ERC 32	170
Hi-Q/ERC 40	220
Hi-Q/ERBC 50/AF	375

- The specifications apply to collets type ER-GB.
We recommend a tightening torque of 80% of the max. torque.

Important: In order to avoid damage to the holder, please counter with open-ended spanner 2 while tightening the clamping nut with wrench 1.

The wrenches are not included in the delivery. Please order the following assembly sets, consisting of a wrench for tightening the clamping nut and a wrench for countering, separately:

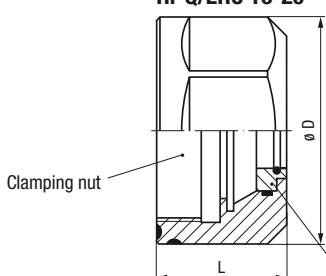

Assembly set for:	Article no.

Assembly of the coolant-lubricant tube in the hollow taper (HSK) shank

1. Put assembly wrench on the coolant-lubricant tube.

Important: Watch the position of the pins against the grooves!

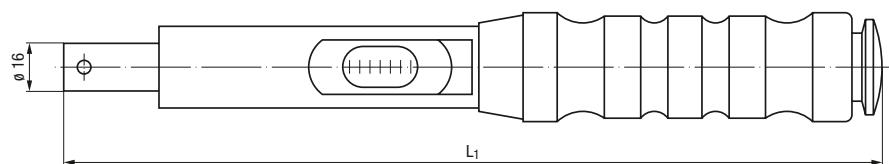

2. Screw coolant-lubricant tube into the shank.
