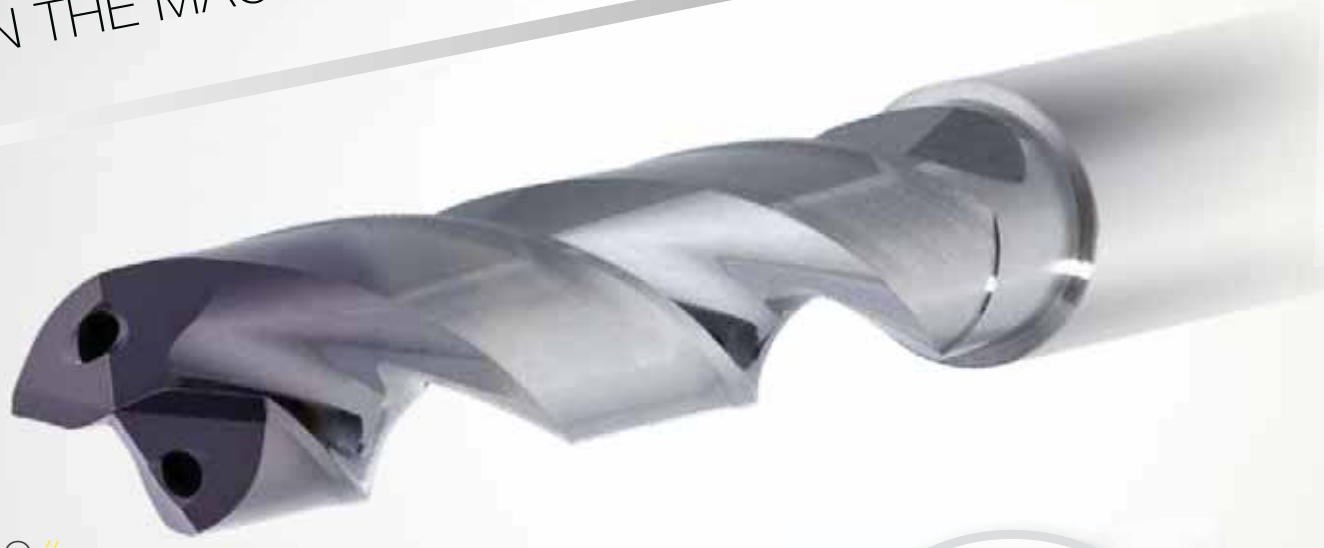
Innovations

Guhring sets the standard with every innovation. Perfection in research, development and tool manufacturing. Machining perfection is our aspiration.

PREMIUM QUALITY
IN THE MACHINING OF STEEL

NEW



//RATIO//

RT 100 S

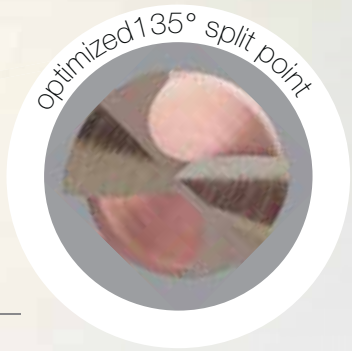
// Optimized micro-geometry for steel
// High cutting parameters
// Consistently long tool life

NEW

AeroX

// HSCO8 twist drills for assembly work in general or high-alloyed materials, titanium and aluminum materials
// Quick drill advance thanks to optimized 135° NAS 907 split point

OPTIMIZED DRILL CORE
Heavily reduced tapered core for additional tool stability while simultaneously minimizing forces



NEW

nano-FIREX® coating
for maximum wear and heat resistance

HSCO
NC spotting drills
with nano-FIREX® coating

// Accurate spotting with higher cutting parameters and tool life
// Maximum performance thanks to nano-FIREX® coating

Innovations

State-of-the-art materials require progressive machining processes. Guhring secures the technology leadership with trend-setting research and innovative concepts for rotary cutting tools.

NEW

INNOVATIVE DESIGN
for more efficient cooling

NEW

//RATIO//

RT 100 Trigon®

// Optimized flow velocity
// Especially suitable for the machining of stainless steels, titanium- and special alloys
// Increased coolant volume

NEW

MORE ECONOMICALLY EFFICIENT DRILLING *of aluminum materials*

ALUMINIUM

N

//RATIO//

RT 100 AL

// Entire material range of soft and tough aluminum found in both wrought and cast alloys.
// Special drills for Ø 3 mm to 20 mm and depths up to 12xD
// Wet machining and MQL possible

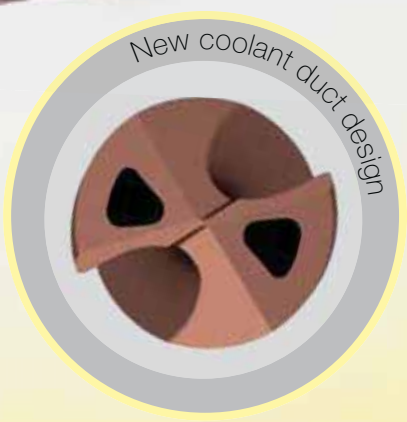
NEW

NEW

//RATIO//

RT 100 type C

// Especially suitable for the machining of long-chipping steels
// Excellent chip evacuation even with reduced cutting speeds
// Flute form and cutting edge geometry optimally adapted to the machining task



R&D FIBER COMPOSITE PLASTICS
tooling solutions for highly abrasive materials

MACHINING OF FCP

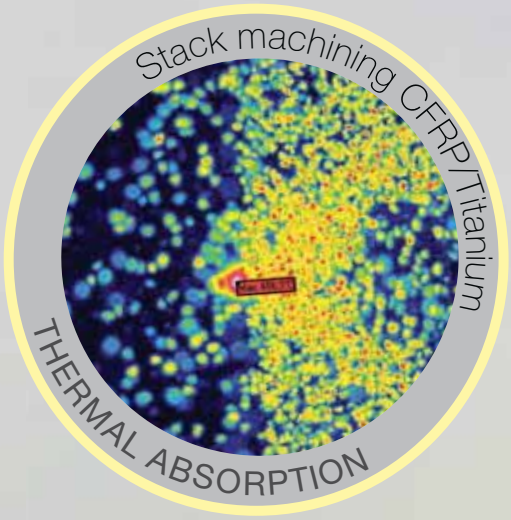
Optimized tools for the machining of glass fibre reinforced plastics (GFRP) and carbon fiber reinforced plastics (CFRP) as well as stack materials

// Components without fiber projections
// Delamination-free component surface
// No damage to component through “peel-up” or “push out”
// Prevention of fiber splitting “pull-out” on component
// Minimizing burr development
// Prevention of thermal damage

FCP DRILLING OPERATION
with optimal machining quality

NEW

VIBRATION SUPPORTED MACHINING
process optimization thanks to overlayed movement



// More favorable chip development/improved chip fracture
// Improved chip evacuation
// Production of nominal fracture points in chip
// Reduced built-up edge
// Lower machining forces and temperatures

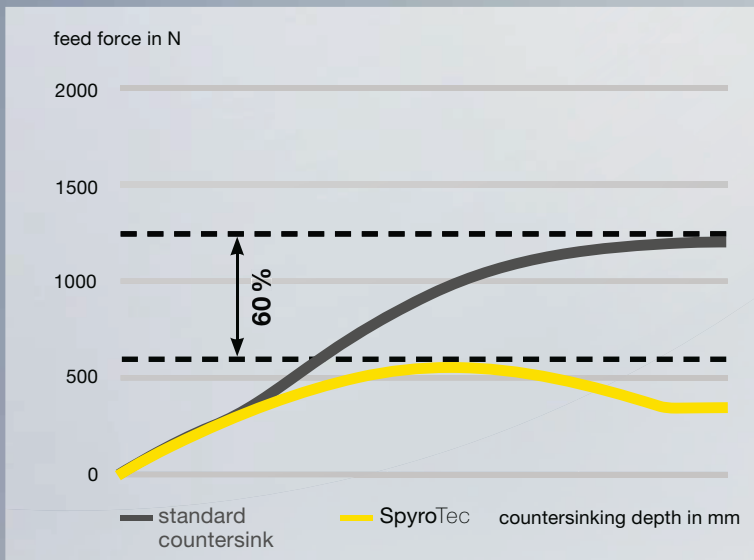
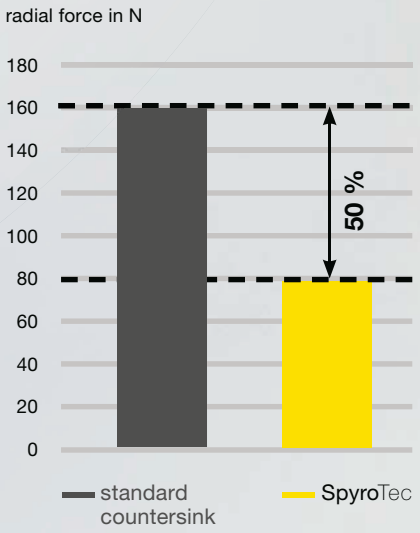
SpyroTec

THE INNOVATIVE, HELICAL HSS AND HSCO COUNTERSINK

The axial and radial forces that occur during countersinking operations are significantly reduced due to the unique geometry of the SpyroTec cutting edges. The convex form and variable pitch of the helical cutting edges results in a stable countersinking process with minimal vibration, even when using a hand drill. Round, precise, chatter-free countersinking is guaranteed. The TiAlN coating ensures higher wear resistance and thermal protection, which guarantees longer tool life in many different materials and applications.



LOWER FEED FORCE BY APPROX. 60%
COMPARED TO STANDARD COUNTERSINKS



LOWER RADIAL FORCE BY APPROX. 50%
COMPARED TO STANDARD COUNTERSINKS

- standard program
- 14 dimensions Ø 6.3 – 31.0 mm
- 90° countersink
  according to DIN 335 form C
- round shank version
- tri-flat shank version
- long length round shank version

web thinning ≥ Ø 1.000 • relieved cone point geometry with special type B web thinning • PM-Co-alloyed high speed steel • especially high rigidity • especially high wear resistance

high-tensile materials, high-alloyed steels • heat treatable and case hardened steels • cast iron, brass, bronze

$t_{max} = l_2\text{-}1.5 \times d_1$

web thinning ≥ Ø 0.970 • relieved cone split point • Co-alloyed high speed steel • increased wear resistance

Titanium and Titanium alloys • stainless/acid-/heat-resistant austenitic steels • high tensile/short chipping steels over 900 N/mm² • Hastelloy, Inconel, Nimonic

$t_{max} = l_2 - 1.5 \times d_1$

web thinning ≥ Ø 3.000 • relieved cone • Co-alloyed high speed steel • wide flutes • increased wear resistance • especially for drilling depths > 3xD

alloyed and unalloyed steel • cast materials over 800 N/mm² • hot and cold rolled steels • antifriction bearing steels • high-alloyed steels • heat treatable and case hardened steels

$t_{max} = l_2\text{-}1.5 \times d_1$

Jobber length drills

Series no. **1018**

~5xD Cutting depth | DIN 338 Standard | AeroX Type | 135° Point angle | h8 Tolerance on Ø | Web Thinning | Cyl Shank form | R Cutting direction | NEW

Tool material **M42**

Surface Bronze Oxide

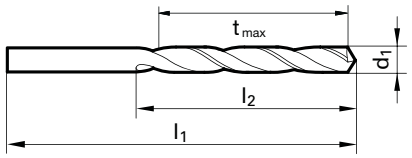
P	Steel	●
M	Stainless steel	●
K	Cast iron	●
N	Aluminum	●
S	Titanium alloys	●
H	Hardened steel	○

●=Optimal
○=Limited

web thinning ≥ Ø 1.000 • optimized NAS 907 split point • 8% cobalt-alloyed HSCO high speed steel for maximum tool life, high thermal resistance and hardness

unalloyed and high-alloyed steel materials • cast materials • non-ferrous metals • Titanium and Titanium alloys

$t_{max} = l_2\text{-}1.5 \times d_1$



Speeds and feeds information on pg. 527

web thinning ≥ Ø 1.000 • relieved cone point geometry with special type B web thinning • PM-Co-alloyed high speed steel • especially high rigidity • especially high wear resistance

high-tensile materials, high-alloyed steels • heat treatable and case hardened steels • cast iron, brass, bronze

$t_{max} = l_2\text{-}1.5 \times d_1$

Tool material: **HSS**

Surface: ○

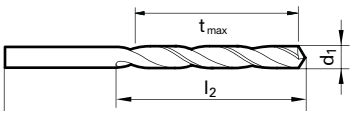
P	Steel	
M	Stainless steel	
K	Cast iron	
N	Aluminum	●
S	Titanium alloys	
H	Hardened steel	

●=Optimal
○=Limited

web thinning ≥ Ø 14.500 • relieved cone • for deep holes

soft, long chipping materials • aluminum, Al-alloys (long-chipping) • zinc, refined copper, silumin, Elektron • soft synthetic materials, wood

$t_{max} = l_2\text{-}1.5 \times d_1$



Speeds and feeds information on pg. 478

web thinning ≥ Ø 1.000 • relieved cone split point • Co-alloyed high speed steel • increased wear resistance

Titanium and Titanium alloys • stainless/acid-/heat-resistant austenitic steels • high tensile/short chipping steels over 900 N/mm² • antifriction bearing steels • Hastelloy, Inconel, Nimonic

$t_{max} = l_2\text{-}1.5 \times d_1$

●=Optimal
○=Limited

web thinning ≥ Ø 1.000 • facet split point • Co-alloyed high speed steel • low feed force required • low torque required • increased wear resistance • for universal application • only suitable for short drilling depths when used at full length for reach purposes

alloyed/unalloyed steels up to 800 N/mm² • cold/hot work steels • antifriction bearing steels • non-ferrous metals • cast materials • stainless steels • plastics

$t_{max} = l_2\text{-}1.5 \times d_1$

web thinning ≥ Ø 1.000 • facet split point • Co-alloyed high speed steel • low feed force required • low torque required • increased wear resistance • for universal application • only suitable for short drilling depths when used at full length for reach purposes

alloyed/unalloyed steels up to 800 N/mm² • cold/hot work steels • antifriction bearing steels • non-ferrous metals • cast materials • stainless steels • plastics

$t_{max} = l_2 - 1.5 \times d_1$

Morse Taper Shank drills

Series no. **654**

~5xD	DIN 345	N	118°	h8		MT	R
Cutting depth	Standard	Type	Point angle	Tolerance on Ø	Web Thinning	Shank form	Cutting direction

Tool material **HSS**

Surface **S**

P	Steel	●
M	Stainless steel	
K	Cast iron	●
N	Aluminum	○
S	Titanium alloys	
H	Hardened steel	

●=Optimal
○=Limited

web thinning ≥ Ø 3.000 • relieved cone

alloyed/unalloyed steel and cast steel • grey cast iron, malleable and spheroidal iron • sintered powder metal, German silver and graphite

Spot Drilling

In order to achieve full performance with Series 6408 carbide micro-precision drills, we recommend spot drilling.

The Series 6400 solid carbide micro-precision drill can be applied for this purpose. The spot drill diameter should be approximately 2/3 of the subsequent hole diameter.

Pilot drilling

It is recommended to utilize a pilot drill for the series 6412 deep hole micro drill. Use series 6400 or 6405 drills with m7 diameter tolerance and 140° point to drill a minimum of 1xD deep. Then enter the pilot hole with the deep hole drill at max. 300RPM and 20IPM stopping shy of the bottom of the pilot hole. Start high pressure coolant and increase RPM to recommended operating speed. Drill at recommended feed rate to hole depth without pecking. Slow to max. 300RPM before retracting.

5xD Ratio drills

Series no. **5515**

5xD Cutting depth | RT 100 U Type | 140° Point angle | m7 Tolerance on Ø | Without Internal coolant | HA Shank form | R Cutting direction

Tool material: **Solid Carbide**

Surface: F

P	Steel	●
M	Stainless steel	○
K	Cast iron	●
N	Aluminum	○
S	Titanium alloys	○
H	Hardened steel	○

●=Optimal
○=Limited

web thinning ≥ Ø 3.000 • facet point grinding • main cutting edge form straight • optimized cutting geometry

structural and case hardened steels • free-cutting steels, heat treatable steels • steels (alloyed/unalloyed) up to 1200 N/mm² • cast materials • bronze, brass • high-alloyed AlSi-alloys

$t_{max} = l_2\text{-}1.5 \times d_1$

5xD Ratio drills

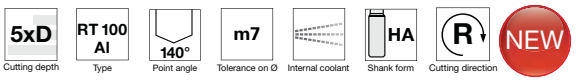
Series no. **5768**

Tool material **Solid Carbide**

Surface



P	Steel	
M	Stainless steel	
K	Cast iron	
N	Aluminum	★
S	Titanium alloys	
H	Hardened steel	

★ = 1st choice
● = Optimal suitability
○ = Limited suitability

relieved cone • main cutting edge is slightly concave • optimized cutting geometry • sharp cutting edges NEW

aluminum and Al-alloys • Al materials with high Si-content

5xD 3-flute drills

Series no. **1452**

5xD Cutting depth | GS 200 U Type | 150° Point angle | h7 Tolerance on Ø | Without Internal coolant | Cyl Shank form | R Cutting direction

Tool material: **Solid Carbide**

Surface: ○

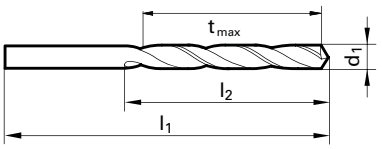
P	Steel	○
M	Stainless steel	
K	Cast iron	○
N	Aluminum	○
S	Titanium alloys	
H	Hardened steel	

●=Optimal
○=Limited

web thinning ≥ Ø 3.000 • facet point grinding • for holes with high alignment accuracy • very good surface quality of hole • suitable for interrupted cutting

cast steel • alloyed/unalloyed steels up to 1000 N/mm²

$t_{max} = l_2\text{-}1{,}5 \times d_1$



Speeds and feeds information on pg. 535

Pilot drilling

It is recommended to utilize a pilot drill for the series **5525** deep hole drill. Use series **5510**, or similar drill with m7 diameter tolerance and 140° point, to drill a minimum of 1xD deep. Then enter the pilot hole with the deep hole drill at max. 300RPM and 20IPM stopping shy of the bottom of the pilot hole. Start high pressure coolant and increase RPM to recommended operating speed. Drill at recommended feed rate to hole depth without pecking. Slow to max. 300RPM before retracting.

3-fluted

- for less powerful machines & less stable clamping conditions
- for turning machines & driven tools
- specially for slotting with smaller milling cutter diameters
- with and without coolant through

4-fluted

- for stable machines & clamping
- high-performance milling with maximum cutting speeds
- with and without coolant through

4-fluted, short

- for more stability when slotting
- up to 25 % higher feed rate
- reduced deflection
- without coolant through

4-fluted, corner radii

- for pocketing and slotting
- multiple radii per diameter
- up to 25 % higher feed rate
- without coolant through

RT100T deep hole drills must utilize a pilot hole. Deep hole drills must never operate at full speed without support in the pilot hole. Use series 5510, or similar drill with m7 diameter tolerance and 140° point, to drill a minimum of 1xD deep. Then enter the pilot hole with the deep hole drill at max. 300RPM and 20IPM stopping shy of the bottom of the pilot hole. Start high pressure coolant and increase RPM to recommended operating speed. Drill at recommended feed rate to hole depth without pecking. Slow to max. 300RPM before retracting.

RT100T deep hole drills must utilize a pilot hole. Deep hole drills must never operate at full speed without support in the pilot hole. Use series 5510, or similar drill with m7 diameter tolerance and 140° point, to drill a minimum of 1xD deep. Then enter the pilot hole with the deep hole drill at max. 300RPM and 20IPM stopping shy of the bottom of the pilot hole. Start high pressure coolant and increase RPM to recommended operating speed. Drill at recommended feed rate to hole depth without pecking. Slow to max. 300RPM before retracting.

Tech Tip:

Gun drills hold location to precise tolerances in extremely deep hole applications. Conventional gun drills consist of a steel body and driver with a brazed carbide head for extended tool life and performance. When applying standard gun drills some basic steps should be observed:

- If you're not drilling on a gun drilling machine supported by a bushing, you must drill a pilot hole using a drill with an m7 tolerance. Our series 5510 drill is suitable. The procedure is similar to the RT100T drills. Enter the pilot hole at low RPM and feed rate (example: 200 RPM at 20 in/min)
- Gun drills for drilling depths over 40xD should enter pilot hole in a counterclockwise direction.
- Continuous drilling without pecking is required.
- Switch off coolant supply after reaching maximum drilling depth. • Use a rapid withdrawal with a stationary spindle.

Tech Tip:

Gun drills hold location to precise tolerances in extremely deep hole applications. Conventional gun drills consist of a steel body and driver with a brazed carbide head for extended tool life and performance. When applying standard gun drills some basic steps should be observed:

- If you're not drilling on a gun drilling machine supported by a bushing, you must drill a pilot hole using a drill with an m7 tolerance. Our series 5510 drill is suitable. The procedure is similar to the RT100T drills. Enter the pilot hole at low RPM and feed rate (example: 200 RPM at 20 in/min)
- Gun drills for drilling depths over 40xD should enter pilot hole in a counterclockwise direction.
- Continuous drilling without pecking is required. • Switch off coolant supply after reaching maximum drilling depth. • Use a rapid withdrawal with a stationary spindle.

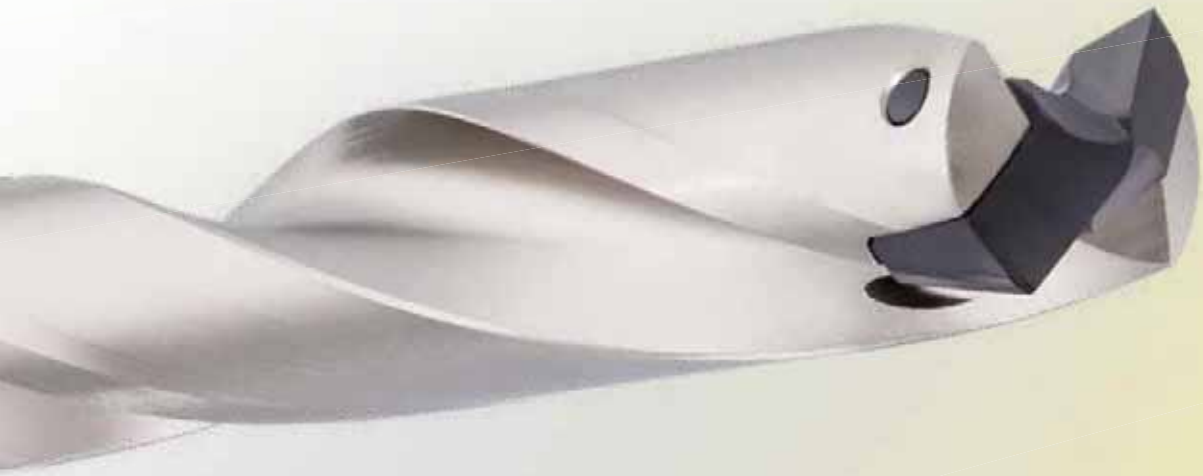
REPLACEABLE TIP DRILLS



HT 800 WP Replaceable Tip Drilling System

With the HT 800 WP interchangeable drilling system Guhring provides high-performance and cost-efficient drill bodies for hole diameters ranging from 11.00 to 40.0 mm.

The HT 800 WP drilling system is ideal for the production of large, highly accurate holes in various materials, making it suitable for energy, automotive, steel construction, and general machining industries.

EXTENDED TOOL LIFE

- interchangeable inserts perfectly adapted to the field of application regarding tool material, geometry and coating
- optimal machining results in steel, stainless steel, cast iron or aluminum

OPTIMAL CHIP EVACUATION

- special flute cross-section
- ultra-smooth surface finish

RIGID BODIES

- minimal diameter variances between body and insert reduce wear
- improved workpiece surfaces
- improved guidance of the tool increases the rigidity
- longer tool life

HIGHLY ACCURATE AND RIGID INSERT SEAT

- insert change possible in the machine
- holder remains clamped
- tool change and re-setting not required
- increased process reliability and reduced setup time

IDEAL COOLING LUBRICATION

- coolant ducts with maximum cross section
- exit from flute directly to cutting edge

HT 800 WP drill bodies

Series no. **4107**

HT 800 WP (Type) | 3xD (Cutting depth) | Internal coolant | HE (Shank form)

Tool material

Surface Ni

P	Steel
M	Stainless steel
K	Cast iron
N	Aluminum
S	Titanium alloys
H	Hardened steel

●=Optimal
○=Limited

nickel- plated • especially high wear resistance • optimized flute design • optimized coolant duct exit • clamping screws art. no. 4071 included • screwdriver art. no. 1612 included

HT 800 WP drill bodies

Series no. **4108**

HT 800 WP (Type) | 5xD (Cutting depth) | Internal coolant | HE (Shank form)

Tool material

Surface Ni

P	Steel
M	Stainless steel
K	Cast iron
N	Aluminum
S	Titanium alloys
H	Hardened steel

●=Optimal
○=Limited

nickel- plated • especially high wear resistance • optimized flute design • optimized coolant duct exit • clamping screws art. no. 4071 included • screwdriver art. no. 1612 included

HT 800 WP drill bodies

Series no. **4109**

HT 800 WP (Type) | 7xD (Cutting depth) | Internal coolant | HE (Shank form)

Tool material

Surface Ni

P	Steel
M	Stainless steel
K	Cast iron
N	Aluminum
S	Titanium alloys
H	Hardened steel

●=Optimal
○=Limited

nickel- plated • especially high wear resistance • optimized flute design • optimized coolant duct exit • clamping screws art. no. 4071 included • screwdriver art. no. 1612 included

HT 800 WP drill bodies

Series no. **4110**

HT 800 WP (Type) | 10xD (Cutting depth) | Internal coolant | HE (Shank form)

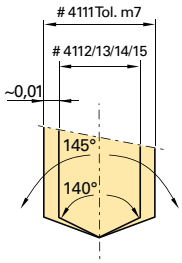
Tool material

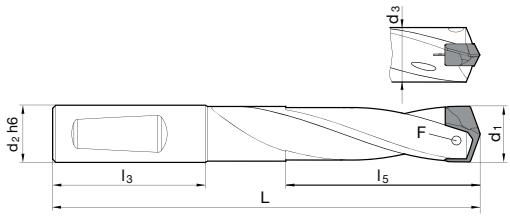
Surface Ni

P	Steel
M	Stainless steel
K	Cast iron
N	Aluminum
S	Titanium alloys
H	Hardened steel

●=Optimal
○=Limited

nickel- plated • especially high wear resistance • optimized flute design • optimized coolant duct exit • clamping screws art. no. 4071 included • screwdriver art. no. 1612 included





Drilling depths over 7xD will typically require piloting operation using shorter drill body series 4105 or 4106, and series 4111 insert.

HT 800 WP drill inserts

Series no. **4114**

HT 800 WP (Type) | 140° (Point angle) | h7 (Tolerance on Ø)

Tool material: **Solid Carbide**

Surface: ◯

P	Steel	
M	Stainless steel	
K	Cast iron	
N	Aluminum	●
S	Titanium alloys	
H	Hardened steel	

●=Optimal
○=Limited

web thinning ≥ Ø 11.000 • relieved cone • main cutting edge form concave • clamping screws art. no. 4071 included

aluminium and Al-alloys • non-ferrous metals

HT 800 WP drill inserts

Series no. **4112**

HT 800 WP (Type) | 140° (Point angle) | h7 (Tolerance on Ø)

Tool material: **Solid Carbide**

Surface: **F**

P	Steel	●
M	Stainless steel	○
K	Cast iron	○
N	Aluminum	
S	Titanium alloys	
H	Hardened steel	

●=Optimal
○=Limited

web thinning ≥ Ø 11.000 • facet point grinding • main cutting edge form straight (after correction) • clamping screws art. no. 4071 included

S structural and case hardened steels • free-cutting steels, heattreatable steels • alloyed steels up to 1200 N/mm²

RT 100 TRIGON®

Innovative Design for more efficient cooling

In stainless steels the high chrome and nickel content ensures a high corrosion resistance and high tensile strength. Consequently, however, the machinability of the material decreases, process temperatures increase. Nevertheless, RT 100 TRIGON® ensures high cutting speeds and feed rates – made possible by the innovative coolant duct geometry.

Flute form

A specially developed flute form with the highest surface finish as well as the 4-facet point geometry ensures optimal chip generation and cutting characteristics.

Corner preparation

The TiAlN based coating and special corner preparation reduces the extreme stresses on the cutting edge during machining and provides high wear resistance.

The new form of coolant duct optimizes the coolant volume, the flow rate and the flow direction, extreme process temperatures are optimally dissipated. In comparison to conventional round coolant ducts the cooling medium is specifically guided to the most stressed areas, the major cutting edge and the cutting edge corners of the drill.

Cutting edge geometry

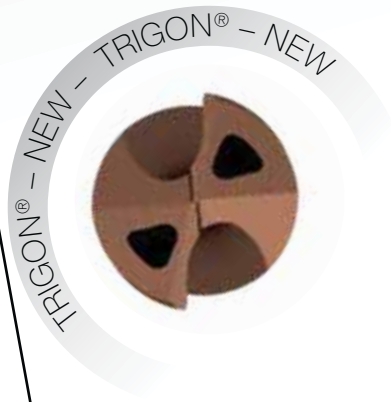
Major cutting edges with a concave form ensure perfect penetration and cutting characteristics when machining long-chipping steels. Cutting forces and temperatures are considerably reduced.

Flute form

The flute form with narrow geometry, especially designed for long-chipping steels, ensures optimal chip generation characteristics even at low cutting speeds.

A high surface quality and a excellent coating ensure optimal chip evacuation. High process temperatures are dissipated safely.

New coolant duct design



The new form of coolant duct optimizes the coolant volume, the flow rate and the flow direction, extreme process temperatures are optimally dissipated. In comparison to conventional round coolant ducts the cooling medium is specifically guided to the most stressed areas, the major cutting edge and the cutting edge corners of the drill.

Cutting edge preparation

RT 100 type C impresses with its special cutting edge preparation that is complemented with its edge geometry and excellent surface quality. The tool life is increased considerably and in addition the formation of micro cracks and built-up edges is avoided.

RT 100 AL

Guhring's new solid carbide drill for the machining of aluminum materials

For aluminum drilling chip formation with chip evacuation are both of vital importance.
With RT 100 AL optimal chip formation is achieved at the cutting edge in the entire material range – from tough aluminum wrought alloys to aluminum cast alloys with high silicon content.

Extremely high surface finish quality of web thinning, front face and clearance rake areas

- reduction in process temperatures
- prevents formation of built-up edges

Open point geometry and cutting edge form:

- optimal chip formation behavior

Sharp, micro-treated cutting edges

- perfect cutting behavior, also in heat-treated AlSi-alloys
- short chip fracture also in aluminum wrought alloys

Flute geometry

- polished flutes for optimal chip evacuation
- minimizing friction
- prevention of material adhesion

RT 100 AL distinguishes itself thanks to an ideal geometry with high surface finish qualities in the web thinning, front face and clearance rake areas. Micro-treated cutting edges and corners complement the point geometry and ensure perfect cutting behavior, low process temperatures prevent the formation of built-up edges when machining aluminum.

Fiber composite plastics (FCP's)

Modern fiber composite plastics (FCP's) are making an entry into a broad range of industrial applications for reasons of efficiency, weight reduction, strength and dynamics. With their specific properties they extend the group of conventional metal lightweight construction materials such as aluminum- and titanium-alloys. FCP's or multi-material systems, ie. a mixture of FCP and metallic materials, are therefore no longer exclusively retained for the aerospace industry, motorsport and other high-end applications.

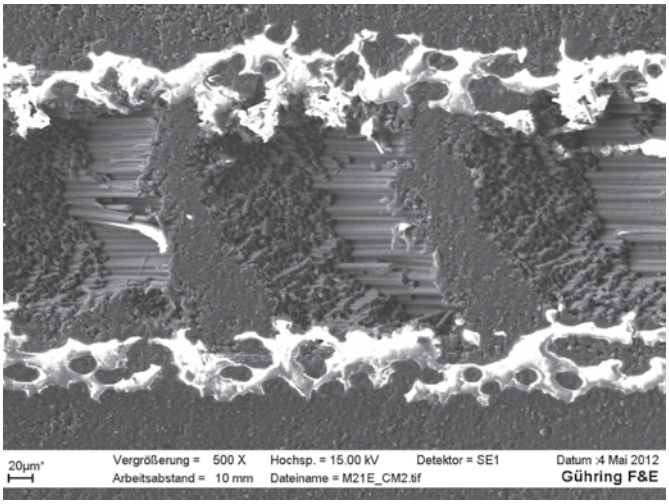
It is especially worth high-lighting the great growth in the vehicle and commercial vehicle technology, the wind energy sector as well as general mechanical engineering. FCP's are applied where high specific strength and low weight as well as high dynamic or energy efficient processes can be found.

Since the mid 1980's Guhring has provided tooling solutions in the standard and special sector for the machining of FCP's. This long-term experience resulted in the development of a wide variety of specialized high-performance tools, adapted to different conditions and application cases such as manual drilling, drilling with drill feed units, machining with robots or machining in conventional machining centers.

Guhring tools for the machining of FCP meet the general requirements for the machining of modern lightweight construction materials.

- Components without fiber projections
- Delamination-free component surface
- No component damage through "peel-up" or "push-out"
- Prevention of split fibers "pull-outs" on component
- Minimizing burr development
- Prevention of thermal damage

For the machining of FCP materials without component damage, cutting edge quality and wear resistance of the tool material are of absolute importance. Prerequisite for a process reliable separation of the heavily abrasive fibers, especially materials with a fiber volume ratio of more than 55 percent, is a sharp cutting edge.



CFRP cutting area with 500-fold magnification
The scanning electron microscope shows how the materials fiber structure and fiber direction is retained after machining. Fibers are neither pressed into the matrix, nor torn out of the composite.

GFRP / CFRP

Glass fiber reinforced plastics (GFRP) are industrially applied in large volume for wind energy applications as well as in the transportation and construction sector. GFRP is generally only applied for moderately load bearing components, mostly large area shell components. The lesser load bearing GFRP components are in many cases preferred to the lighter carbon fiber reinforced plastics (CFRP) as they can be produced considerably more cost-efficient and are easier to machine.

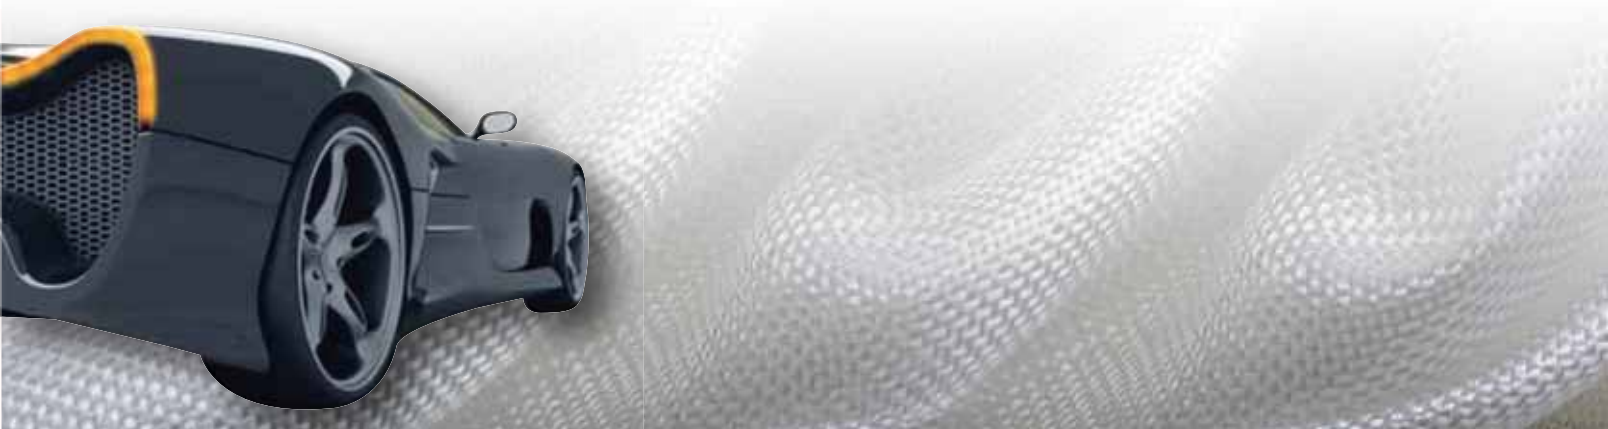
Carbon reinforced plastics (CFRP) by comparison have considerably higher strength. Depending on the manufacturing process and fiber diameter, pure carbon fibers achieve a higher tensile strength weight ratio compared with steel materials. For this reason CFRP is extensively used for high load bearing structural components.

To protect the fibers in CFRP and GFRP from applied forces they are bedded into a matrix. The ratio of fiber to matrix determines the so-called fiber volume ratio and in heavily stressed CFRP components it can be up to 65 percent. For finish machining the type of fiber and fiber direction of the components must be observed. The fiber direction with CFRP is the deciding factor for the tendency for the material to delaminate and fiber splitting. Therefore, unidirectional layers especially at the hole exit tend to delaminate heavily. The tendency to delaminate must be counteracted with the tool geometry.

typical delamination

without delamination

The machining of CFRP and GFRP materials require specific tooling solutions especially designed to suit the heavily abrasive fibers. To prevent typical FCP component damage, Guhring provides application specific high-performance tools. This prevents the material from delaminating due to targeted control of the cutting forces.



FCP drilling operations

For drilling operations, specific drilling tools with different point geometries are applied. Thanks to specifically designed tools, the fibers can be reliably separated in unidirectional fiber layers as well as in fabric layers. Delamination on the component surface on tool entry and exit ("peel up" / "push out") as well as in the component can be prevented.

Stack materials

The combination of at least two different materials with differing properties is described as a stack material or just stack. Often applied material pairings for lightweight construction applications are CFRP/titanium as well as CFRP/aluminium. But also other combinations of the materials CFRP, titanium, stainless steel and aluminum in different combinations are possible. To insert the connection elements, the different materials must be machined together in a process. The challenge for cutting tools during the machining process results from the very different material properties and the machining strategies of the combined materials. When machining CFRP/titanium stacks CFRP is heavily abrasive and quickly leads to a rounding of the cutting edges of the tool. Titanium in contrast is very tough and causes high machining temperatures due to its low thermal conductivity. The CFRP is very quickly damaged when machining due to high machining forces and temperatures. Despite the different materials a secure accurate machining process must be ensured over a long tool life.

Guhring also provides special solid carbide, coated carbide and PCD tooling solutions for this material group. They are specially adapted to the respective material structure and ensure chip evacuation as well as uniform hole diameters across all materials.

Process optimization when machining with added movement

The machining of new materials with fiber reinforced materials to very tough materials such as titanium- or copper-alloys as well as very brittle ceramic materials poses a challenge for conventional machining because of the extreme wear and chip formation behavior. New approaches for process optimization by added motion in feed direction open new opportunities for improved chip formation, reduced process forces and higher quality of the produced surfaces as well as maximizing the achievable tool life.

Basic considerations

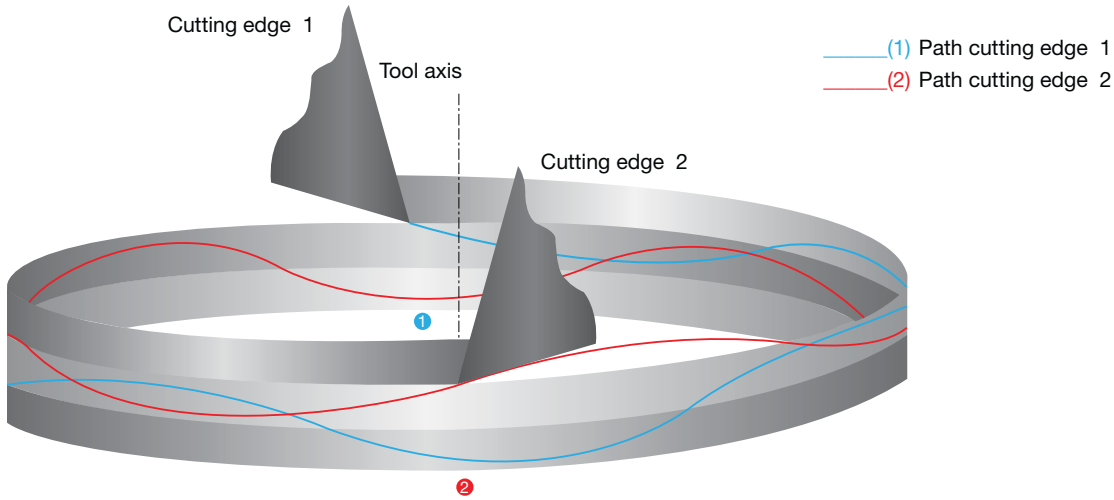
When adding axial movements via a continuous feed movement, different frequency ranges from a few Hertz up to several thousand Hertz are applied depending on the application case. In addition, a defined modification of effective direction angle and an increase in tool cutting edge speed is made. Dependent on the application and tool type, various effects are achieved by vibration supported machining.

Machining with added movement is currently applied for the machining of difficult-to-machine materials such as super-alloys, fiber-reinforced plastics and stack-materials as well as long-chipping alloys, for example, lead-free copper-alloys. With added vibration, one differentiates between low-frequency and high-frequency vibrations.

- more favorable chip formation/improved chip fracture
- improved chip evacuation
- production of predetermined breaking point in chip
- reduced built up edge
- prolonging tool life
- reduced machining forces
- reduced temperatures

1.) Low-frequency impulse

With low-frequency impulse frequencies to 1 kHz and amplitudes up to 0.5 mm are used. This category also includes programmed pecking by lifting the tool or an interrupted feed movement by dwelling cycles. On conventional machining centers, , this discontinuous feed movement cannot be increased unrestrictedly due to the limited dynamics of axial movement. To achieve added movement with frequencies matching multiple spindle machines, special mechanical transmissions are applied. These transmissions can be directly integrated in the machine or designed as gear heads attached to the spindle. The stroke is mechanically produced by the gear ratio in the feed axis or by moving over a corresponding cam disc.
Deviating from a spiral-shaped cutting path with a constant chip thickness when drilling with a constant feed rate, the addition of axial movement results in varying chip thickness.



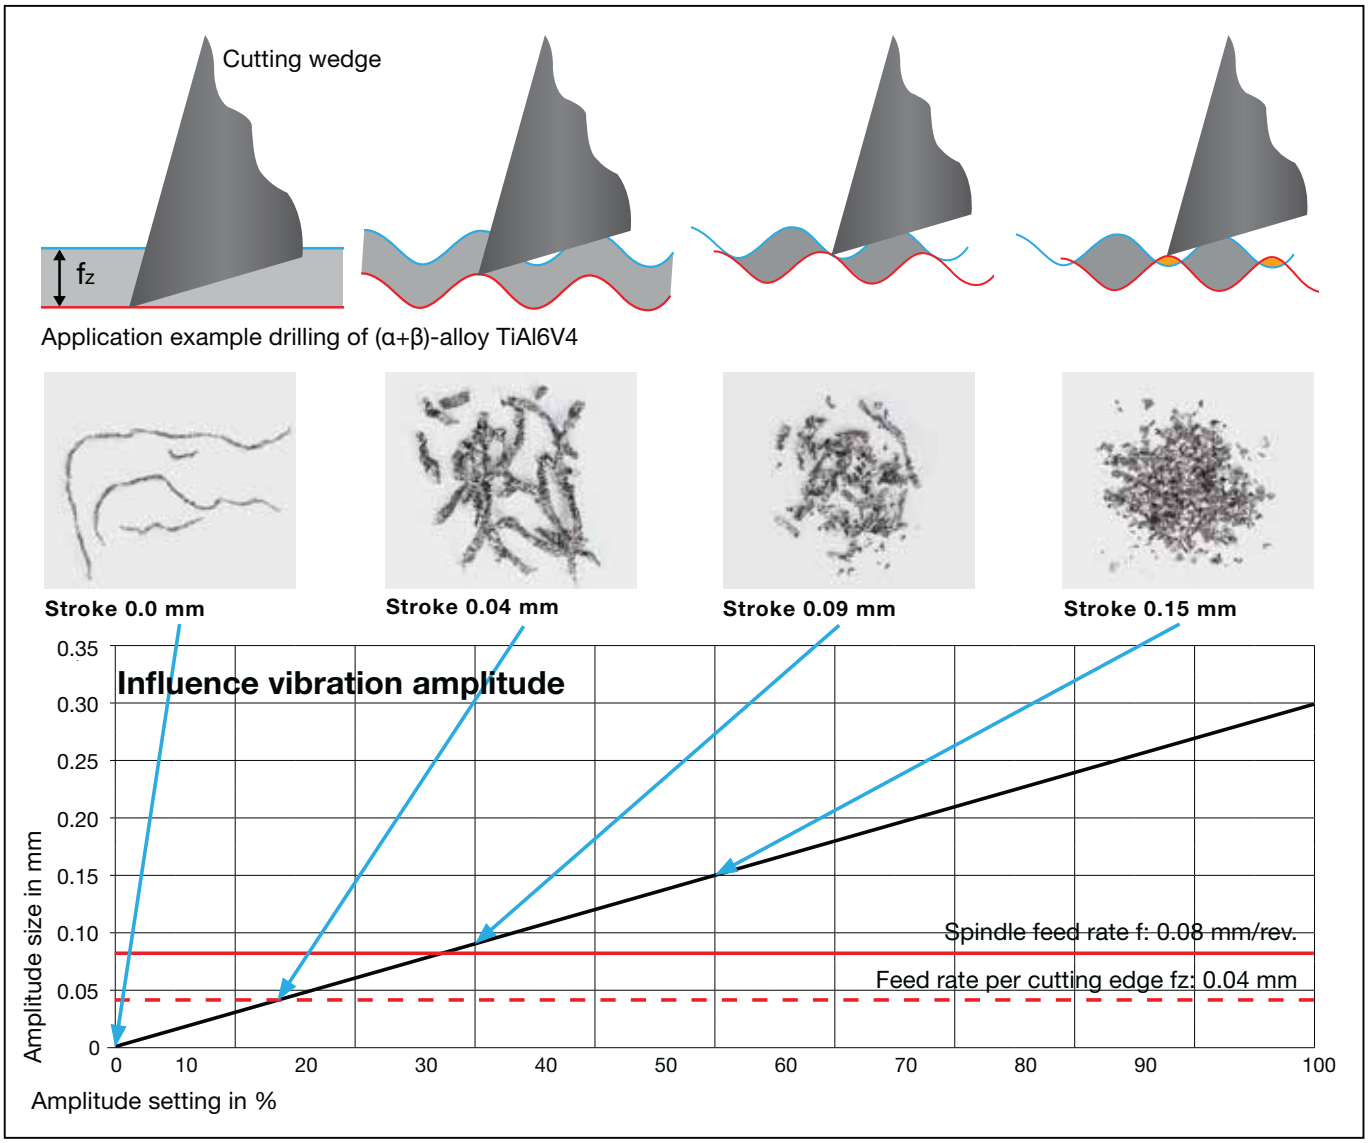
Low-frequency added axial movement enables the production of controllable chips, even with ductile materials. The amplitude of the added axial movement controls the chip thickness. The amplitude setting can be changed to control the chip as a peck and therefore an interruption of the chip formation. With rotational speed linked frequency, the number of pecks can be determined.

Influence of vibration on chip formation

In a test, holes were produced in a standard titanium-alloy (TiAl6V4), where the levels of vibration were varied. All tests were carried out completely dry with identical drilling tools of diameter d = 6.35 mm. The cutting rates were vc = 30 m/min and f = 0.08 mm/rev.

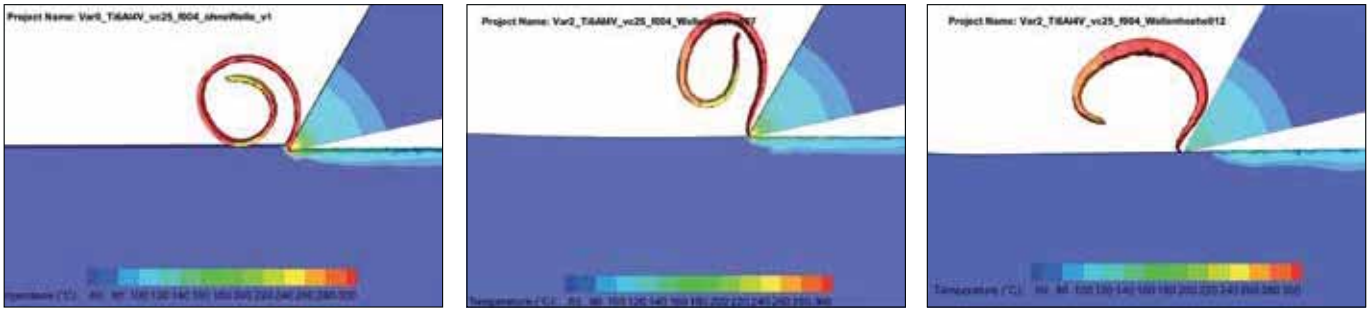
An observation of the produced chips clearly shows the influence of amplitude on the chip formation. Already an amplitude in the height of the chip thickness clearly reduces the chip length. To produce very short chips, without exception in ductile materials, the amplitude must be selected considerably higher than the feed rate of the cutting edges. Therefore, the cutting edge completely lifts-off the workpiece surface and the chip formation process is specifically interrupted

Machining with applied vibration is already well established for the machining of hybrid material combinations, so-called sandwich or stack materials. Here, leaching in fiber composite layers can be prevented and machining temperatures reduced in total thanks to securing the chip break.



Influence of applied vibration on the process temperature

With the assistance of the Finite-Element-Method (FEM) the chip formation at the cutting edge is simulated for different application conditions. The following images show a the chip in a FEM simulation. The results of the simulation show the increasing chip thickness and shortening of the chip with the amplitude of the vibration. Furthermore, it shows with a continuous cut a higher temperature level is achieved at the cutting edge



This becomes especially clear when comparing the machining temperatures when machining CFRP/titanium material combinations. Identical drilling tools with diameter d = 6.35 mm were applied dry for the test. The cutting rates were vc = 30 m/min and f = 0.08 mm/rev.

The heat created during the machining of a CFRP/titanium stack material is recorded in real time with a thermography camera. The test panel had a total thickness of 20 mm, 6 mm CFRP and 14 mm titanium (TiAl6V4). It was drilled so that the remaining residual wall was 1.5 mm to the panel face. A comparison of the temperature at the cutting edge on exit of the material and chip temperature was measured to show the difference between conventional machining and machining with vibration. Without vibration, a maximum temperature of 600° C was measured at the cutting edge. With vibration the maximum temperature under identical conditions was reduced by approximately a third to under 450° C. Furthermore, a considerably improved hole quality and increased tool life was achieved thanks to an improved chip break.

2.) High-frequency impulse (ultra-sound supported)

With high-frequency impulse metal-cutting manufacturing processes – also called ultra-sound supported – an overlaying of the conventional process kinematics with an oscillating tool movement in axial direction takes place exhibiting a considerably higher frequency of > 16.55 kHz in contrast to a low-frequency impulse. The maximum achievable amplitude at the tool point, mostly between 2…30 µm, is heavily dependent on the combination of tool, impulse system and power applied, as the oscillation results from the impulse of the tool with its resonance frequency.

The impulse takes place via actuator, consisting of a generator, converter, booster and the combination of tool and holder, the so-called sonotrode. The generator converts electrical energy into high-frequency sine oscillation that is transferred to the converter. The booster transforms from the converter received vibration amplitude and transfers it enlarged to the sonotrode in which the electrical energy is converted into mechanical energy by piezo actuators.

The combination of feed movement and an oscillating linear movement also enables a more economical machining of high-tensile materials such as ceramic composite materials. Previously, ultra-sound supported machining was predominantly applied for the machining of so-called advance materials such as glass, ceramics and carbide using tools with geometrically undefined cutting edges. High-frequency impulse machining is increasingly applied also in the machining with a defined cutting edge thanks to the drilling and milling of composite materials such as fiber reinforced plastics, sandwich structures and foam. When machining with a defined cutting edge a micro-break-up supports the machining of the material partly visible affecting the surface quality and resulting in a reduction of the process forces.

Alongside positively influencing the wear behavior when machining steel materials, a reduction in edge build-up can be identified when drilling nickel based alloys.

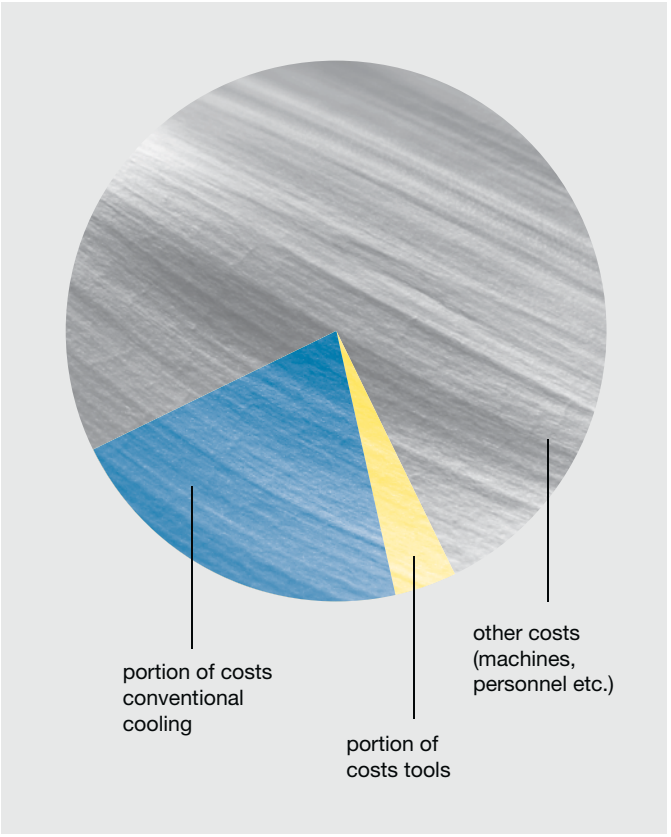
MQL technology

Basics

Alongside the machine and tooling the costs for coolant are a considerable portion of the overall cost of the machining process. Therefore, a reduction in the cooling lubrication requirements offers a potential for cost savings.

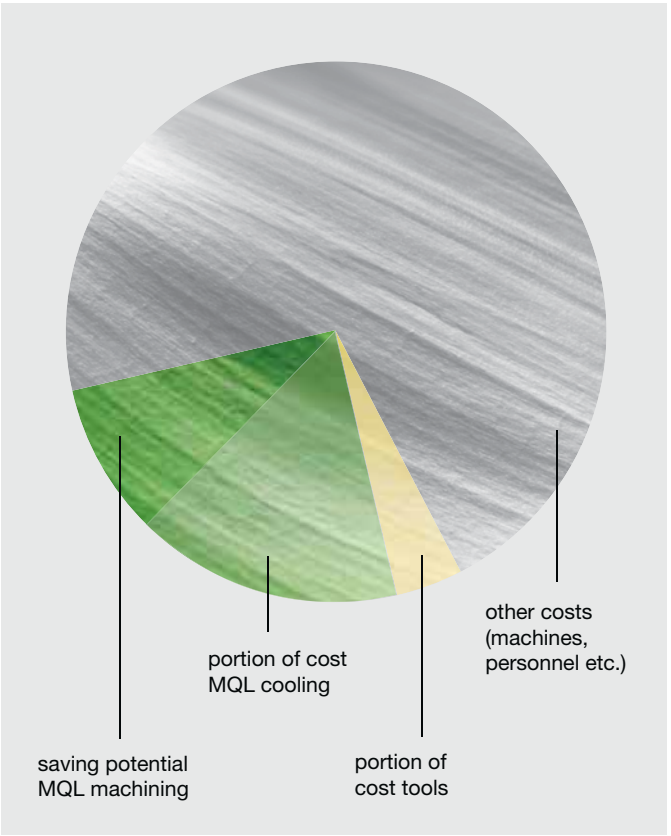
The reduction of cooling lubricants is not only cost saving but is also of benefit to the environment and health protection. Guhring is one of the pioneers in the research and development of MQL that began in the mid 1990's.



The aim of MQL machining

The acquisition of a new MQL cooling lubricant system is significantly less expensive than conventional cooling!

- reduction of thermal stresses at the tool point
- less tool wear
- effective chip evacuation from deep holes
- reduction of cooling lubricant requirement
- high cooling and lubrication effect especially in deep holes
- lowering the resulting costs such as:
  - component cleaning costs
  - cooling lubricant disposal costs
  - swarf disposal costs
- environment and health protection



The development of present-day MQL systems

Thanks to the research in MQL machining Guhring created the precondition for a practical MQL technology. From the clamping set to the tool's cutting edge all the components were integrated in the development – the result was the first MQL delivery system.

Features:
- modular constructed and standardized system
- MQL and conventional clamping set are freely interchangeable thanks to an identical spindle contour
- hydraulic, shrink fit and synchro chucks are all designed for the MQL clamping set

Guhring's current MQL system

By incorporating the MQL length adjustment screw to Guhring's first MQL delivery system in 2007, the original drawback was eliminated. There is, therefore, currently a MQL delivery system available to the customer that optimally meets the requirements of the present-day production process.

Features of the first Guhring MQL delivery system:
- no lubricant delays
- special MQL coolant delivery unit
- MQL suitable tool shank end
- tapered length setting screw

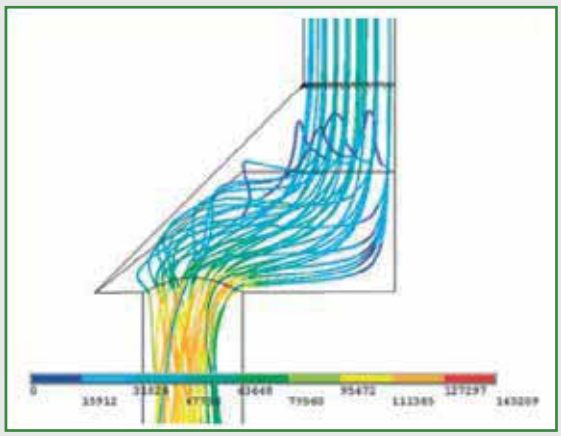
The user, therefore, benefits from a standardized system and a clearly reduced stock keeping thanks to compatible components.

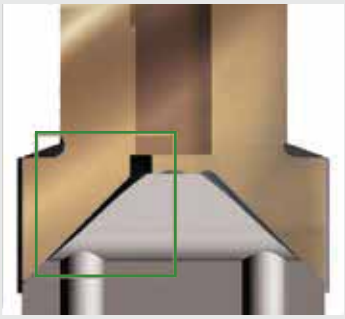
Optimally formed shank end!
For a secure MQL delivery

The delivery of these extremely low coolant quantities directly to the effective area is of utmost importance. Hereby, the geometric design of the shank end plays a significant role! The Guhring developed conical shank end optimally satisfies the relevant MQL conditions.

Advantages of the tapered shank end:
- no lubricant delays
- minimal dead area
- simple operation
- cost-efficient production

Flow pattern with low vortex formation





Flow conditions in the coolant duct connection slot at the point of the tapered transition

Keeping a cool point

With MQL the process temperature can be considerably reduced in comparison to dry machining resulting in longer tool life and an increased process reliability.

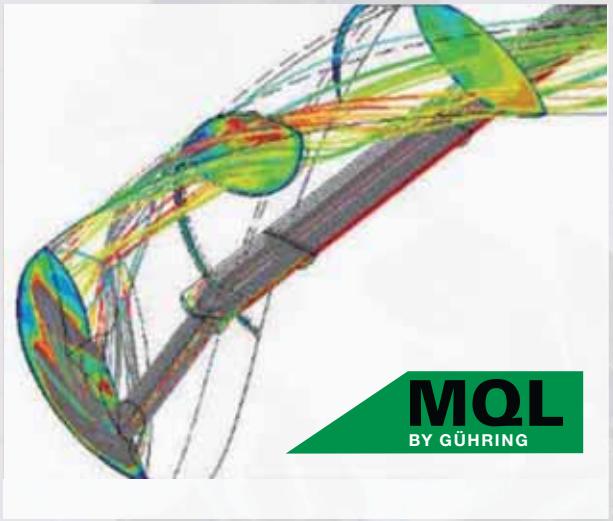
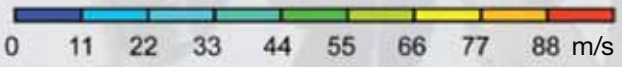
Optimal MQL machining results thanks to the optimized tool geometry of RT 100 T!

1. Flute cross section:
The flute geometry of Guhring MQL tools ensures short chips that are optimally evacuated from deep holes.

2. Maximum coolant duct cross-section:
The cooling lubricant supply as well as the chip evacuation have been optimized through the tool' maximum coolant duct cross-section.

Flow speed comparison

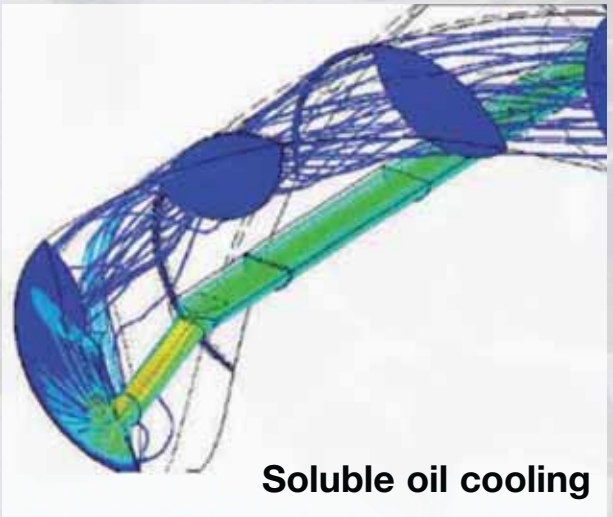




The flow speed
in the flute with MQL is 30.4 m/s.

The volume with MQL
is 6.960 l/h (std.litres air/h).

Tool Ø = 11.7 mm
Pressure at pump = 6 bar
Pressure at tool = 4 bar



The flow speed
In the flute with soluble oil is 3.5 m/s.

The volume with soluble oil
is 600 l/h (std.litres air/h).

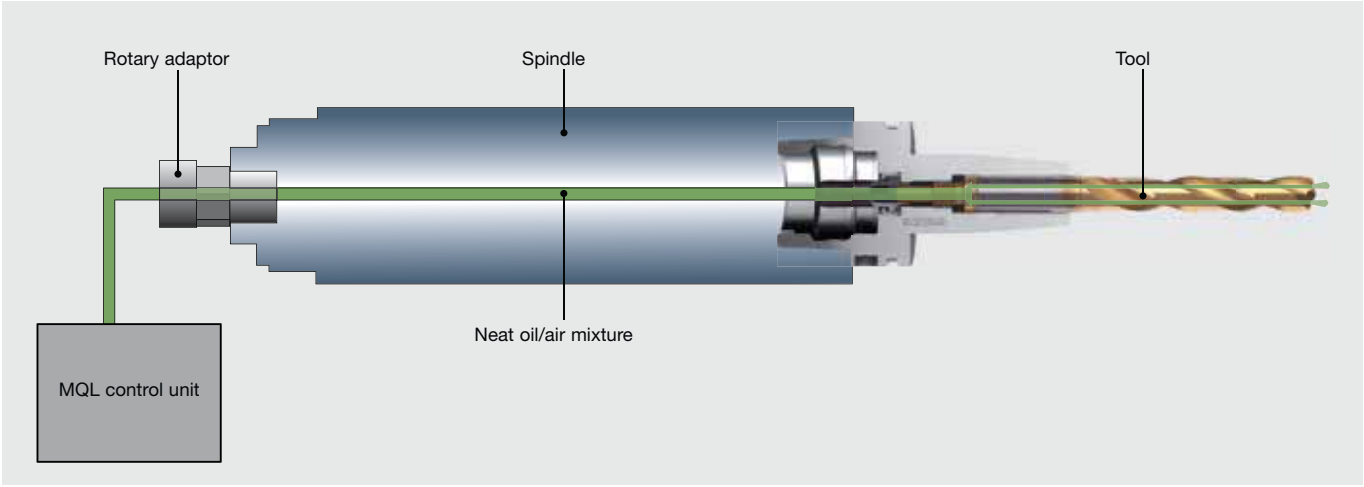
Tool Ø = 11.7 mm
Pressure at pump = 60 bar
Pressure at tool = 31 bar

MQL system types

The provision of the MQL medium to the tool can be achieved in two ways: the aerosol mixture can be prepared outside the machine and conveyed to the machining location (1-channel system) or compressed air and MQL medium are conveyed separately to the mixing chamber where they are then mixed together (2-channel system). The aerosol feed to the machining location is achieved via a suitable minimal quantity lubrication rotary adaptor (preferably with axial flowthrough), the spindle, the clamping system and finally the cutting tool. Unavoidable cross-section modifications should be as streamlined as possible.

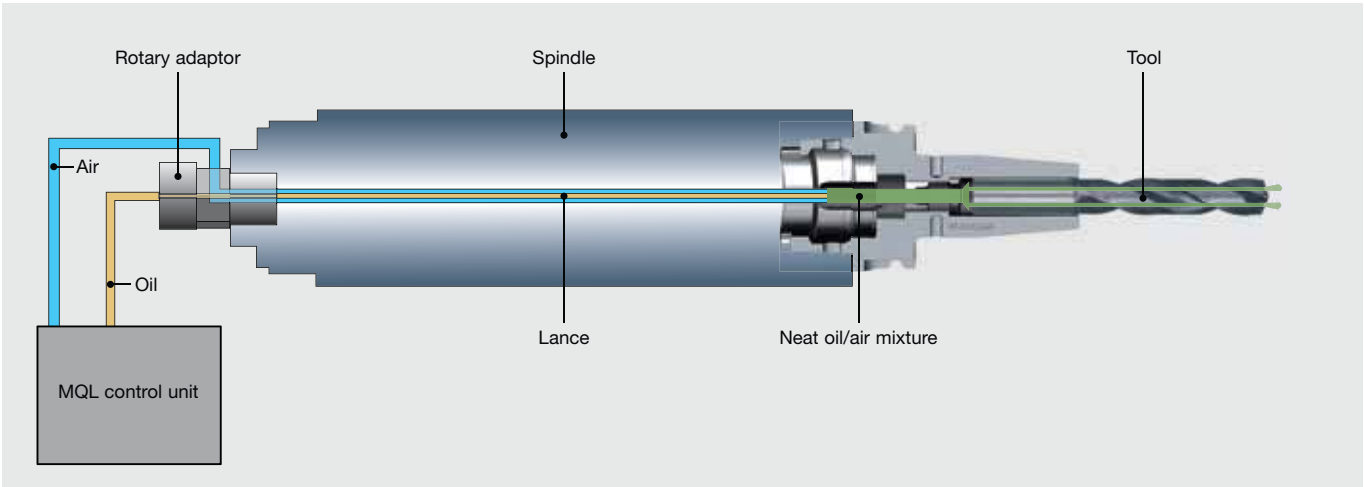
1-channel MQL system

With a 1-channel MQL system, a lubricating aerosol is created in a separate MQL unit attached to the machine tool. Specialnozzle systems inside a pressurised container create a lubricating aerosol via a regulated compressed air feed, its neatoil content adjustable and then maintained within the physical limits by the MQL control.



The 2-channel MQL system

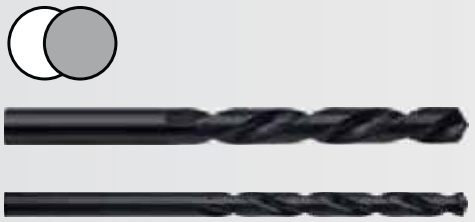
With a 2-channel system the neat oil reaches the rotary adaptor from the unit via a ring line and a as short as possible stub line. In it is incorporated a quick valve that regulates minute quantities of neat oil. The neat oil is transported into the tool holder via a lance attached in the spindle. The second channel of the rotary adaptor is used for the air supply to the tool holder. Only at this point the air is mixed with the neat oil. To achieve this, the tool holder possesses a pressed-in pipe nozzle in which the mixing chamber is located. Neat oil and air can be mixed with this system in more or less any quantities. The route from the mixing chamber to the point of destination is only minimal resulting in a rapid response time and allowing a very quick alteration of the volume of neat oil.



Bright finish

Especially for the machining of wrought and cast aluminum alloys with a high silicon content, uncoated drills offer a very good machining performance. In order to counter adhesive (formation of built-up edges), these tools are optimally suited to this field of application thanks to a special geometry combined with a high surface quality in the point thinning, flute and clearance areas.

Steam tempered/nitrided surface finish



A steam tempered surface finish provides an improved corrosion protection as well as an improved tribological behavior of the tools thanks to the oxidation of the surface area (approx. 3 to 10 µm). Nitriding the land is recommended for abrasive applications, it increases the hardness of the surface on the land and therefore improves wear resistance of the tool. However, using hard material / soft material coatings often provide better results, this type of surface treatment is becoming increasingly less important.

TiN coating

Max. application temperature: <600° C
Color: Golden yellow
Structure: Single-layer
Hardness: 2300 HV0.05

Introduced by Guhring at the beginning of the 1980's, TiN-coating is applied to HSS and carbide for drilling operations as a cost-efficient general purpose coating.

FIREX®/nano-FIREX® coating

Max. application temperature: <800° C
Color: Violet
Structure: Multi-layer
Hardness: 3300 HV0.05

FIREX® and nano-FIREX® coatings contain aluminum, titanium and nitrogen. These coatings were introduced towards the end of the 1990's and are a further development of the TiN-coating. They excel thanks to increased hardness and good thermochemical resistance, they are suitable for HSS and carbide.

nano-Ra coating

Max. application temperature: < 800°C
Color: Pale golden
Structure: Multi-layer
Hardness: 3300 HV0.05

The TiN/TiAlN multi-layer structure of Raptor is the key component for the good performance when machining steel. Thanks to the additional friction reducing top layer coating, based on zircon, the performance could now be further extended for steels that tend to adhere during machining (i.e. ferritic, austenitic and Duplex steels).

TiAlN coating

Max. application temperature: <800° C
Color: Violet
Structure: Single-layer
Hardness: 3300 HV0.05

The TiAlN coating displays similar characteristics to FIREX and nano-FIREX and with its single-layer structure is mostly applied in the field of micro-precision drills.

nano-A coating

Max. application temperature: <900° C
Color: Blue violet
Structure: Multi-layer, nano-structured
Hardness: 3300 HV0.05

TiAlN based nano-A has proven itself in the machining of stainless steels and is suitable for drilling cast iron, nickel based alloys and cobalt chrome alloys. Thanks to its nano-layered structure the fracture growth is delayed. Furthermore, thanks to its adapted composition it possesses a higher thermochemical resistance than for example TiAlN.

Sirius coating

Max. application temperature: < 900°C
Color: Pale golden
Structure: Multi-layer, nano-structured
Hardness: 3400 HV0.05

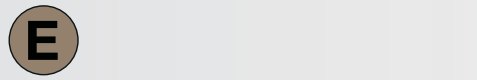
Sirius, essentially based on AlTiN is especially suitable for the machining of stainless steels. Thanks to the nano-structured design, it displays good hardness and toughness. The zircon containing top layer coating is to largely eliminate chemical reactions with the material and therefore encourage chip evacuation.

nano-Si coating

Max. application temperature: <800° C
Color: Bronze
Structure: Multi-layered nano-composite
Hardness: 5500 HV0.05

The nano-Si coating belongs to the group of Nano-composites. The microstructure features extremely fine TiAlN nano-crystals bedded into a glass-like, high temperature resistant silicon nitride matrix. This results in a high hardness especially making the nano-Si coating the first choice for hardened steels and cast materials.

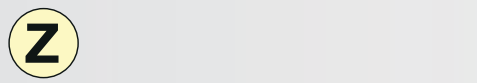
Endurum coating



Max. application temperature: <800° C
Color: Copper
Structure: Multi-layered nano-composite
Hardness: 4000 HV0.05

Endurum coating, another coating of the Nano-composite family, this was specifically designed for the machining of carbon, free-cutting and manganese alloyed steels.

Zenit coating



Max. application temperature: <700° C
Color: Pale gold
Structure: Multi-layer, nano-structured
Hardness: 2500 HV0.05

The nano-structured Zenit coating was specifically optimized for the machining of titanium alloys. The special structure as well as the composition contribute to a significant reduction of tribochemical wear and therefore make it a true specialist. In parallel it also achieves good results when drilling aluminium cast alloys with moderate silicon content.

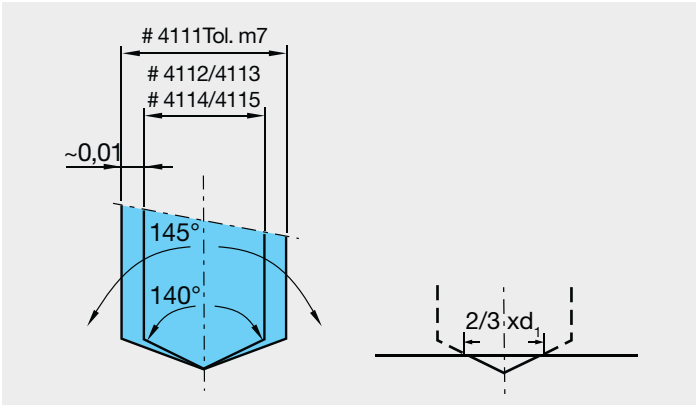
***Note:** The overview shows the general application recommendations for Guhring coatings.*
Prioritization is from top to bottom.

Centering and pilot drilling

Centering and pilot drilling for HT 800

Generally we recommend centering/pilot drilling for HT 800 with drilling depths above 7xD.

When centering, the drilling diameter should be approximately 2/3 of the hole diameter to be produced.
With pilot drilling we recommend a drilling depth of 1xD. In addition, the point angle as well as the diameter of the pilot drill should be larger than the point angle and the diameter of the following drill.
To ensure this, we recommend the application of the adapted pilot drilling inserts series no. 4111 with 145° point angle and m7 diameter tolerance in an extra short, rigid holder series no. 4105 or 4106

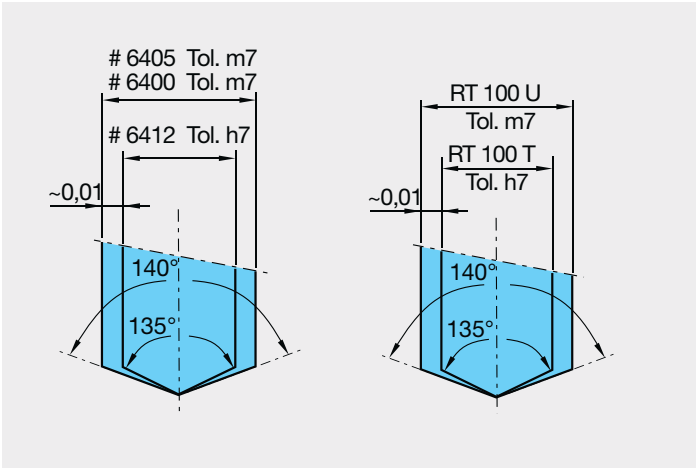


Centering and pilot drilling for solid carbide

When applying solid carbide drills for drilling depths of 12xD we recommend centering or the production of a pilot hole with a depth of 1xD to 2xD.
With drilling depths larger than 12xD a pilot hole with a depth of 1xD to 2xD is imperative.

With pilot drilling for the Exclusive Line micro-precision drill with 15xD (series no. 6412) we recommend the application of Exclusive Line micro-precision drill 4xD without internal cooling (series no. 6400) or 5xD with internal cooling (series no. 6405), as they are optimally adapted regarding point angle and diameter tolerance.

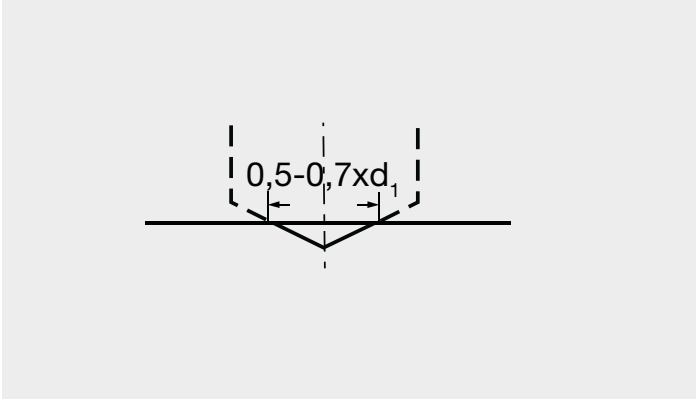
When pilot drilling for deep hole drills eg. type RT100T, a Ratio drill type RT100U with internal cooling, 3xD (e.g. series no. 5510) can be applied, as it is optimally suited regarding point angle and diameter tolerance.



Centering and pilot drilling for HSS

Centering with drill lengths to DIN 340

When using long series drills (DIN340) in HSS/HSCO, we recommend spot drilling with a spotting diameter of 0.5 to 0.7xD (D = drill diameter). HSS NC spotting drills are optimally suited for this process. Detailed information regarding NC spotting drills can be found in the NC spot drilling section.



Pilot drilling with drill lengths to DIN 1869

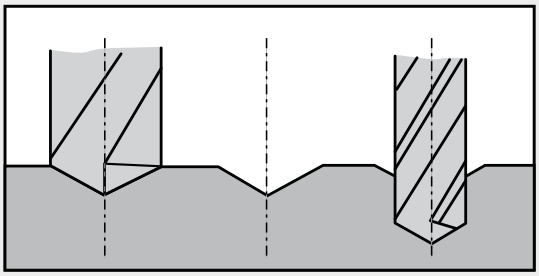
When applying extra length HSS/HSCO drills to DIN 1869 we recommend the production of a pilot hole with a depth of 1xD to 2xD.
Stub drills type GV 120 to DIN 1897 are optimally suited.

NC spotting drills

NC spotting drills

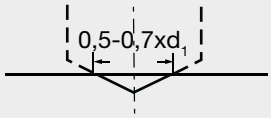
When producing accurately positioned holes, holes with close diameter tolerances, deep holes or generally with unfavorably shaped workpieces (round, rough. etc.) it's recommended to use a NC spotting drill. This ensures the following drill, drills accurately and prevents the drill from running off.
NC spotting drills can also be used to produce chamfers or countersinks (when using a spot drill with a larger diameter than the actual hole) and centering in one operation.

NC spotting drills are designed with a very short flute length and without body clearance to ensure a very rigid design and therefore accurately positioned spotting. Due to the design, NC spot drills are only suitable for spotting, drilling depths must not exceed the length of the point geometry.



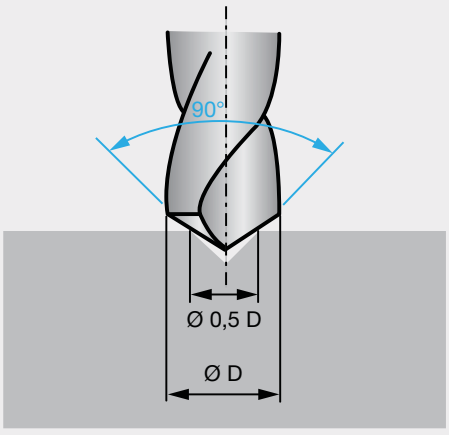
Selecting an NC spotting drill

Ideally, the spotting diameter should be chosen between 0.5 to 0.7xD.



90° NC spotting drills

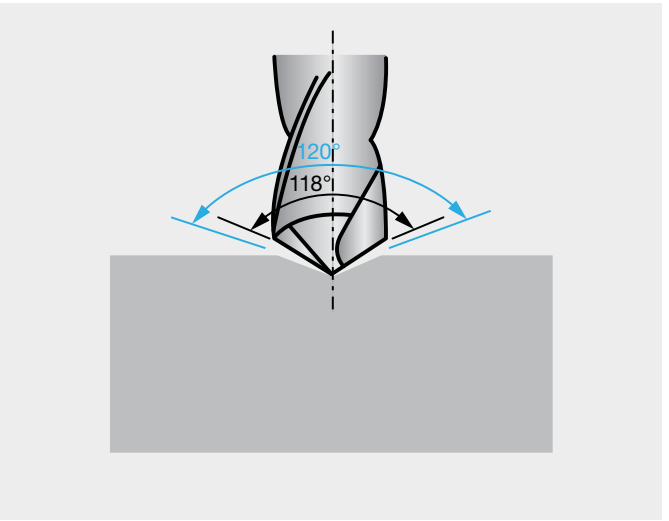
NC spotting drills with a 90° point angle are ideally suited for spotting if the following HSS/HSCO drills have a relatively large chisel edge. This ensures that the following HSS/HSCO drill drills with the cutting lip first and is guided by the most stable points of the cutting edge.
In addition, NC spotting drills with a 90° point angle are used to produce a 90° countersink and center in one operation if the spotting diameter is larger than the actual hole diameter.



NC spotting drills

120° NC-spotting drills

NC-spotting drills with a 120° point angle are specially suited for spotting operations if the actual hole is subsequently produced with HSS/HSCO drills with a 118° point angle. This ensures the following HSS/HSCO drill spots with the point first and is well guided.



142° NC-spotting drills

NC-spotting drills with 142° point angle are specially suited for spotting operations if the actual hole is subsequently produced with carbide drills with a 135° - 140° point angle. This ensures the following carbide drill spots with the point first, centers and is well guided. If the cutting corners of the carbide drill meet the material to be machined before the point, there is the risk of corner crumbling with carbide drills.

Coolant pressure and volumes Ratio drills

The illustrated optimum, good and minimum required coolant volume apply only to spiral-fluted Ratio drills type RT 100. In contrast to the pressure, which is a feature of the machine tool; the cooling system fitted to it and also the possibility of leakage, volume does not depend on the machine (fig. 1). The pressure figures given are therefore recommendations which serve only as guidelines. Ratio drills type RT 80 with central coolant duct are subject to different standards (fig. 2). The diagrams shown are for Ratio drills in their most important application, machining of steel. But they are also guidelines for the machining of other materials, primarily because the highest coolant pressures are constantly required for the machining of steel. The effects of cooling using straight-fluted Ratio drills type RT 150 is particularly sensitive and is clearly demonstrated in the examples for particular workpiece materials. For example, the loss in tool life through low pressures when machining grey cast iron is considerably higher than when machining AlSi alloys. But this is only the case when the AlSi alloy is short-chipping! The absolute necessary minimum pressure or good pressure should, when machining cast iron, be generally a little higher than for AlSi machining (figures 3 and 4).

The recommended values are to be used only for drilling depths of up to approx. 5 x D. Deeper holes should be produced with tools having internal coolant ducts, as for example RT 150 GN, otherwise the production of deeper holes (depending on the material) becomes uneconomical.

The overall total of the maximum positive and negative deviations is the sum of the total run-out in relation to the black circle as measured on standard instruments (dRmax). The red lines at the hole centers indicate the direction and amplitude of the displacements AV (Axis Shifting) of the produced hole from the true center point. The parameter showing the largest deviation is decisive for the IT quality class of the hole in relation to the tool diameter.

The black circle in the diagram represents the nominal hole diameter which the tool should ideally produce. The red circle indicates the form actually produced.
The mean value of the radius of the red circle, i.e. the average diameter, is shown by the blue circle. (with our Ratio drills the average diameter is practically identical to the actual diameter produced).

A brief introduction to the subject of deep hole gun drilling

In the machining world, drilling depths of 10xD and deeper are regarded as deep hole drilling operations, whereby smaller drilling depths can naturally also be produced with gun drills. Advantage is taken of the positive side effects, as for example good surface quality, low deviation from concentricity and optimized alignment accuracy..

High pressure cooling -
has become a matter of course.
In recent years, internal cooling has established itself for all drilling tools. Coolants are now living up to their name and being supplied via coolant ducts to where they are urgently required. Considerable improvements in tool life and less breakages have been achieved by this measure for twist drills, taps etc.
Every conventional machine tool currently on the market can be supplied with high pressure internal cooling and is therefore also suitable for deep hole drilling.
The share of gun drills on machining centers, lathes etc. is forever gaining more importance. The process is therefore increasing in popularity in the machining world.

All gun drills must have support for the pilot hole.
Gun drills must never operate at full speed without support in the machine shop.

Attention!
Gun drills with steel shanks are predominantly NOT suitable for shrink fitting (exception T16 see next page)

Typical procedure with all gun drills on conventional machine tools
- production of pilot hole (L ≈ 3xD, tolerance H8)
- enter at low revolutions, approx. 200 rev./min, feed rate approx. 500 mm/min. With tools for drilling depths in excess than 40xD enter the pilot hole revolving in left hand direction.
- setting of coolant pressure and revolutions
- uninterrupted drilling to required drilling depth without wood pecking. When applying gun drills with increased length-diameter-ratio, we recommend machining with reduced cutting parameters (approx. 75% of the optimal cutting speed) up to a drilling depth of approx. 25 mm.
- switching off coolant supply after reaching the required hole depth
- withdrawal in top gear (max. 10 m/min) with stationary spindle

Application advice
- For drilling depths in excess than 40xD we recommend the use of two or more gun drills, e. g. Ø 10 x 400 mm and Ø 9.95 x 800 mm.
- Gun drills for drilling depths of more than 40xD should enter the pilot hole revolving in the left hand direction.
- When changing tools for drilling depths of more than 40xD, the tool can be damped by switching on coolant supply for just one second.
- Generally we recommend the use of soluble oil with a minimum oil content of 10 %.
- Single-fluted gun drills for long-chipping aluminum should be supplied with point grind 180° and coolant chamber.
- For optimized bore straightness an additional cylindrical guide part can be used (optional).

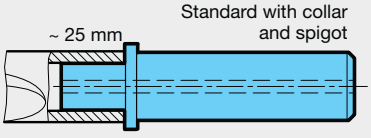
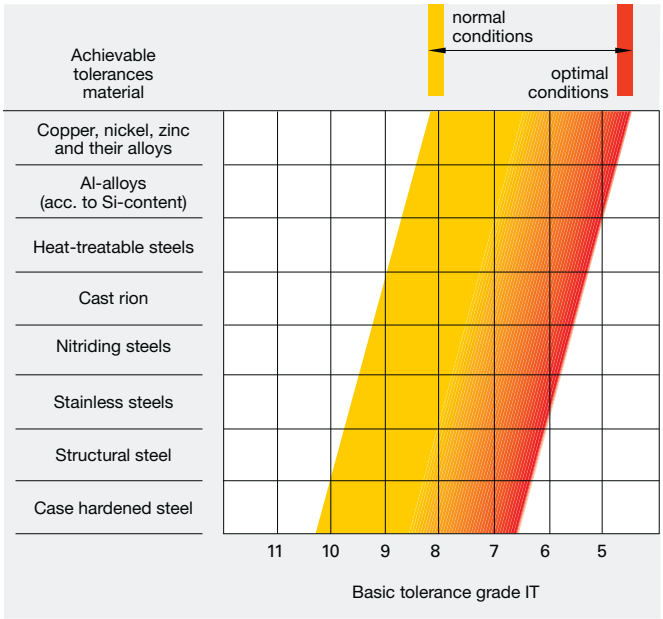
Solution for nom.-Ø > driver-Ø: tube shank installed over spigot, inside-Ø of tube shank >driver-Ø, tube shank fits against collar shoulder.



Single fluted gun drill accuracy

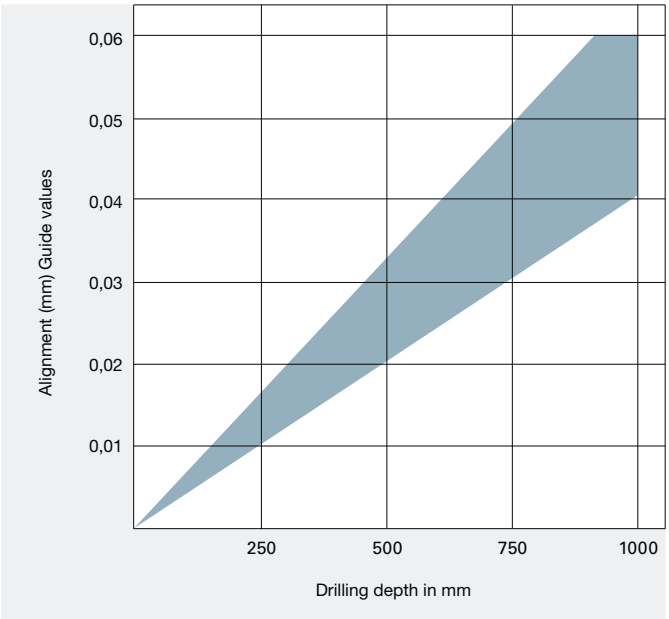
Basic tolerances*

The application of single-fluted gun drills can achieve a lower basic tolerance, as the cutting forces at the cutting edge are absorbed by the supporting strips, unlike twist drills where the slightest deviation of the two cutting edges causes a larger hole.



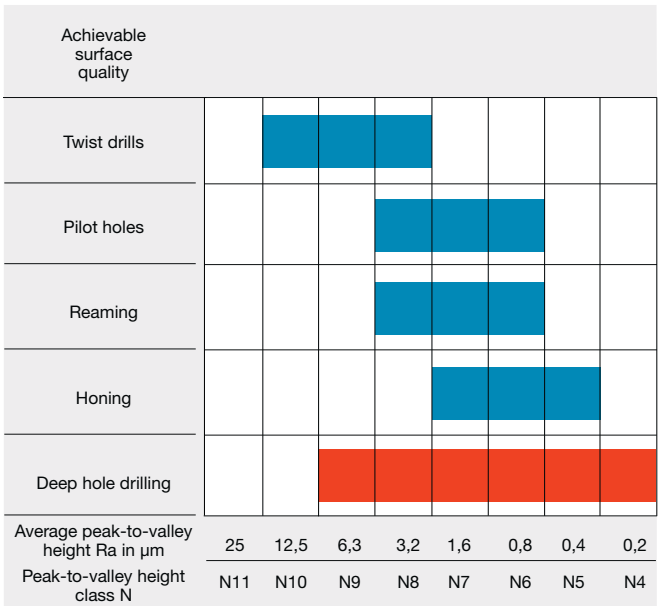
Alignment accuracy*

Because brazed single-fluted gun drills always have the precision carbide head brazed on to a flexible tube, the tool achieves very accurate aligned holes remaining unaffected by possible concentricity errors.
However, extreme material fluctuations and other influencing factors can impair the alignment accuracy.



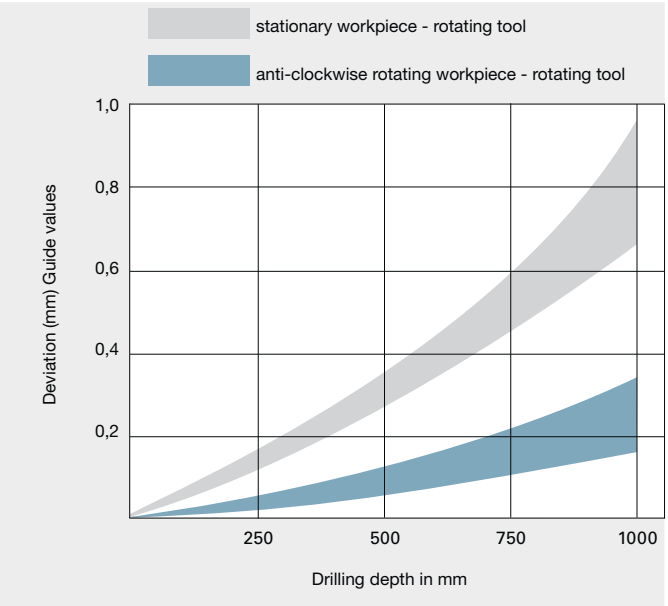
Surface quality*

The forces at the cutting edge are absorbed by the support bushes, which in return burnishes the surface.
Lubrication between the supporting strips and hole surface is therefore very important.
The better the lubricant, the better the surface quality.



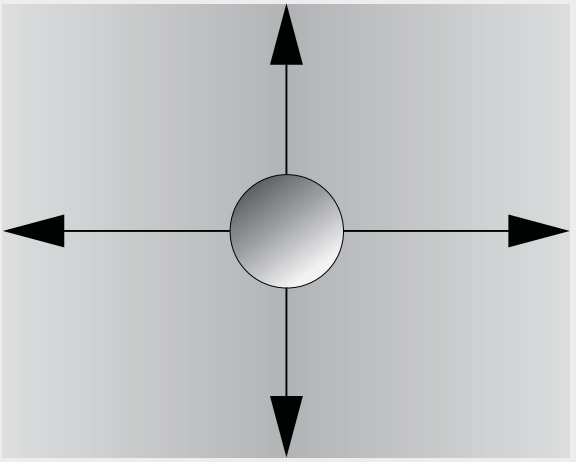
Deviation from concentricity*

When a hole is produced with, for example, a commercial twist drill, the quality of the point grind affects the concentricity of the hole. An imbalance of forces is created at the cutting edges. With gun drills, these cutting forces are absorbed by the supporting strips, resulting in excellent concentricity.

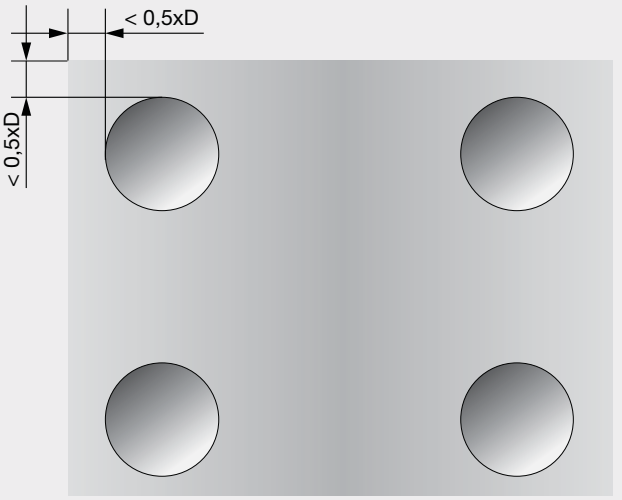


** Gun drills with two cutting edges – straight-fluted as well as spiral-fluted – achieve approx. twice of the values stated*

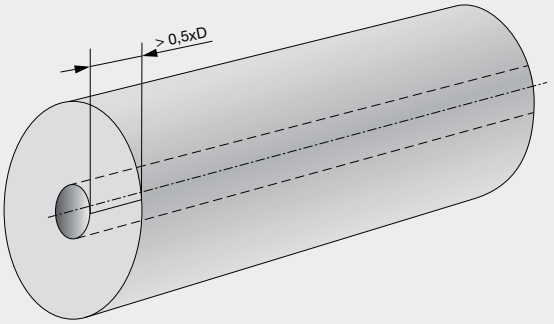
Hole straightness/deviation



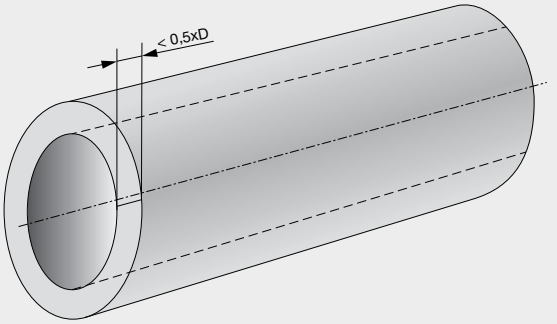
Hole distance to edge > 0.5xD



Hole distance to edge < 0.5xD



Sufficient wall distance
(> 0.5xD) > optimal



Minimum distance (0.5xD)
falling short → can lead to losses
in hole straightness

Coolant values

Please note:

- All gun drills must be applied with internal cooling, either air, water or oil. Without internal cooling the chips cannot be evacuated.
- All gun drills can be applied with oil as the medium for internal cooling. However, in this case a 30% higher pressure is required in order to achieve the same coolant volume.
- When MQL is applied with gun drills an increase in pressure may be necessary for smaller nominal diameters dependent on the pressure of the MQL system.
- If the cooling lubricant data is insufficient the cutting parameters may be reduced. Pressure boosting systems are also possible.
- With increased gun drill length a pressure increase has to be expected to transport the required coolant volume through the coolant ducts.

High speed steels

We only produce tools in the highest quality, carefully selected high speed grades. Depending on the alloying component, the tools have specific properties suited to the application case:

Tungsten, molybdenum: Increases the temper resistance and the wear resistance.
Vanadium: Increases the wear resistance.
Cobalt: Increases the wear resistance, increases the thermal hardness.

Guhring description	Type	Field of application, properties
HSS	Conventional high speed steel	Standard tool material for universal applications
HSCO / HSS-E	Cobalt-alloyed high speed steel	Tool material with high thermal hardness for increased demands, especially suitable for higher machining temperatures or unfavorable cooling.
M42	8% cobalt-alloyed high speed steel	Tool material with increased thermal resistance and hardness,suitable for machining difficult-to-machine materials.
HSS-E		
HSS-E-PM	Powder metallurgically produced cobalt-alloyed high speed steel	Tool material with a very dense and uniform structure. High hardness and thermal resistance, high wear resistance and cutting edge stability.

The most important carbide grades for Guhring tools

The following table lists the most important carbides that are available from Guhring ex-stock for general applications.

In more than 80% of applications known to Guhring, the results of DK460UF carbide grade tools together with a specially adapted coating could not be surpassed by any other carbide grades, including coated tools. This and the availability of the material ex-stock simplify tool selection immensely. For further information regarding the application of other carbide grades please contact our technical engineers.

Grade	Co-content [M-%]	Tungsten carbide grain size [µm]	Hardness [HV]	ISO classification [ISO 513]	Characteristics
DK460UF K40UF	10	0.6	1620	K20-K40	A carbide grade with wide range of application possibilities. It is applied, mostly coated, for the machining of steel, soft Al alloys, cast iron as well as “super alloys” such as Inconel 718. This grade is the backbone of our carbide production.
DK500UF K44UF	12	0.5	1690	K20-K30	The grade has been especially developed for hard machining. It possesses a higher hardness and deformation tolerance in comparison to DK460UF. Due to the high Co-content, a coated application is strongly recommended.
DK255F	8	0.7	1720	K20	The grade is recommended for hard machining, the machining of high tensile grey cast iron and hard AlSi-alloys. Dry machining is possible. A coated application is preferable.
DK120	6	1.3	1620	K15-K20	The grade is especially suitable for the application with diamond coating.
DK120UF	7	0.7	1850	K05-K10	Ultra fine grain type offering extreme wear resistance, suitable for absolutely rigid machines, preferred for reamers.
K55SF	9	0.2-0.4	1920	K05-K10	For application with high wear resistant materials, stainless steels, composite materials such as Kevlar and GRP, high speed machining and dry machining.
DK400N	10	0.7	1580	K20-K40	An extremely tough grade for the machining of high heat resistant metals.
DK256EH	10	0.6	1750	K20	The grade is especially suitable for the machining of nickel-based alloys.
K6UF	6	0.6	1870	K05-K10	Ultra fine grain type offering extreme wear resistance. Especially suitable for application with high wear resistant materials, composite materials, GRP and Kevlar.
K5UF	5	0.5	2010	K05-K10	Newly developed extremely hard grade for drilling and reaming. Especially suitable for application with composite materials and GRP.

Superhard tool materials

It is not only the extreme hardness of superhard tool materials but also their high heat-resistance which enables highest cutting rates and increased productivity. PCD (Poly-Crystalline Diamond) stands for maximum wear resistance. PCD's main field of application is the machining of aluminum and fiber composites. PcBN (Polycrystalline cubic Boron Nitride) finds application in ferrous materials. To unfold the full potential of these tool materials, the application on the most rigid of machine tools is recommended

Guhring description	Classification	Range of application	Average grain size	Diamond content
PCD	Fine grain	Aluminum and AlSi-alloys <10%Si, magnesium alloys, brass, copper, bronze, excellent cutting edge quality, high abrasion resistance, excellent surface qualities.	2-4 µm	> 90% PCD
	Medium grain	Universal grade (general finishing applications) AlSi-alloys <14%Si, copper alloys, graphite and graphite composite materials, fiber composite plastics, unsintered ceramic and carbide (<15% binding metal content) excellent resistance, good surface qualities.	5-10 µm	approx. 92% PCD

Tapping size hole diameter tolerance zone for thread forming (to DIN 13, section 50)

Due to the tensile strength it is not necessary to adhere to the tapping size hole diameter tolerance class 6H; tolerance class 7H satisfies the requirement that the flank coverage of external and internal threads should not fall below 0.32 x P.
In addition, formed threads generally possess a higher tensile strength in comparison to cut threads thanks to an uninterrupted grain flow and subsequent work hardening.

Note: Pilot holes (depth >1xD) are recommended when drilling depths greater than 7xD. The pilot hole can be produced with a short, rigid drill. The diameter should be 0.01 - 0.02 mm larger than the diameter of the finish drill. Ratio drills can produce their own pilot hole by reducing speed and feed rates by 30-40%.

Note: Pilot holes (depth >1xD) are recommended when drilling depths greater than 7xD. The pilot hole can be produced with a short, rigid drill. The diameter should be 0.01 - 0.02 mm larger than the diameter of the finish drill. Ratio drills can produce their own pilot hole by reducing speed and feed rates by 30-40%.

Note: Pilot holes (depth >1xD) are recommended when drilling depths greater than 7xD. The pilot hole can be produced with a short, rigid drill. The diameter should be 0.01 - 0.02 mm larger than the diameter of the finish drill. Ratio drills can produce their own pilot hole by reducing speed and feed rates by 30-40%.

GROOVING SYSTEMS

highest quality and flexibility thanks
to a vast product offering

GRINDING – INDEXABLE INSERTS AND CUTTING INSERTS

Production completed entirely on
Guhring-built grinding machines

COATING – INDEXABLE INSERTS AND CUTTING INSERTS

// In-house coating on
Guhring built coating systems
// Latest coating technology
and coating types

MILLING/TURNING – HOLDER PRODUCTION

GUHRING'S IN-HOUSE CARBIDE PRODUCTION

Blanks – Indexable inserts and cutting inserts
Guhring produced carbide grades
