Company Profile

Kyocera Industrial Ceramics Corporation (KICC), a core company of the Kyocera Group, is a leading manufacturer and provider of **cutting tool products**, advanced ceramic components, liquid crystal displays, thermal printheads, metallized assemblies and industrial lenses. The Kyocera Group is a diversified network of companies working together to create new value for businesses and consumers. Kyoto, Japan-based Kyocera Corporation (NYSE: KYO), the group's global parent, employs approximately 64,000 people in 25 nations and recorded consolidated net sales of approximately US\$13 billion during the year ended March 31, 2010.

Kyocera's Cutting Tool Division is the market leader in Japan and a leading supplier of high-quality tooling solutions in North America with plants in Ohio, North Carolina, and Washington. Kyocera manufactures a diversified product line of turning, milling, Swiss, and drilling products. Our indexable inserts and steel products are manufactured to the highest quality standards and include coated and uncoated carbide, cermet, ceramic, CBN and PCD.

Kyocera's continuous **investment and focus on R&D** has resulted in market beating products such as our innovative CVD coated CA45-Series for cast iron, CA55-series for steel and CA65-series for stainless steel, our high performance MECH helical endmills, our highly acclaimed MFPN high-efficiency 10-edged face mill, and most recently our new line of MEGACOAT carbide, cermet, CBN and ceramic tools, just to name a few.

The Kyocera Industrial Ceramics Corporate headquarters are located in Mountain Home, NC which also serves as the primary North American cutting tool manufacturing plant and is home to the Cutting Tool Division Customer Service, Marketing, and Technical Center staff.

How to Order Kyocera Cutting Tool Products

Kyocera Cutting Tool products are sold exclusively through our North American line of authorized distributors. To locate a local Kyocera Cutting Tool Distributor, please contact Kyocera Customer Service at 800-823-7284.

Using the Kyocera Product Catalogs

All standard Kyocera Cutting Tool Products are located in one of these four General Catalogs.

Stock Status Symbols

●: Indicates that an item is **Stock Standard** and available at our North American Headquarters in North Carolina. Stock Standard items will ship the same day if ordered by 4:30pm (EST).

○: Indicates that an item is **World Express** and available at our Worldwide Headquarters in Japan. Please allow 5-7 business days for World Express items to arrive.

All Stock Standard and World Express items are subject to availability

Kyocera Authorized Distributor Ordering Guide

Order online

To place an order for Kyocera Cutting Tools, please utilize the MyKICC Distributor Website -

<http://mykicc.kyocera.com>

In addition to placing orders, the MyKICC distributor website allows you to view real-time product availability, check pricing, view and download product and promotional literature, watch product training videos, and much, much more.

Call us

- Kyocera Cutting Tool Customer Service – (800) 823-7284.
Representatives are available Monday through Friday from 8:00am to 5:30pm (EST).
- Kyocera Applications Engineers – (800) 823-7284.
Engineers are available Monday through Friday from 8:00am to 5:00pm (EST).

PVD Coated Carbide for Drilling

PVD Coated Carbide

KYOCERA's PVD coated carbide for drilling is coated on a very tough carbide substrate. Because of the low process temperature compared with CVD, it features no erosion of bending strength, less deterioration of coating and realizes superior tool life and stable cutting.

Features of PVD Coated Carbide for Drilling

Workpiece Material	Symbol	Color	Main Component	Advantages
 Steel	PR630	Gold	TiN	<ul style="list-style-type: none"> TiN base PVD coated carbide Application: General purpose drilling of steel
	PR730	Gold	TiAlN+TiN	<ul style="list-style-type: none"> Superior oxidation resistance with well balanced wear resistance and toughness Application: Stable and long tool life at high speed cutting of steel
	PR830	Gold	TiAlN+TiN	<ul style="list-style-type: none"> Improved high temperature stability and wear resistance by TiAlN base PVD coating Application: Stable and long tool life for drilling of steel
	PR1230	Blackish red	MEGACOAT	<ul style="list-style-type: none"> Superior wear and oxidation resistant MEGACOAT coating on special tough carbide substrate Application: Stable and high feed drilling of steel
 Stainless Steel	PR660	Gold	TiN	<ul style="list-style-type: none"> Superior adhesion-resistant TiN base PVD coated carbide on special tough carbide substrate Application: For steel, stainless steel, cast steel and heat-resistant alloys, low speed cutting
	PR1025	Reddish gray	TiCN	<ul style="list-style-type: none"> TiCN base PVD coating on micro-grain carbide Application: Stable and long tool life drilling of stainless steel
	PR1225	Blackish red	MEGACOAT	<ul style="list-style-type: none"> Superior wear and oxidation-resistant MEGACOAT coating on micro-grain carbide substrate Application: General and high feed drilling of steel, stainless steel, and heat-resistant alloys
 Cast Iron	PR905	Bluish violet	TiAlN	<ul style="list-style-type: none"> TiAlN base PVD coating on special tough carbide substrate for cast iron Application: Highly efficient stable drilling of gray and nodular cast iron
	PR1210	Blackish red	MEGACOAT	<ul style="list-style-type: none"> Superior wear and oxidation resistant MEGACOAT coating on special carbide substrate for cast iron Application: Highly efficient stable drilling of gray and nodular cast iron

Carbide

Carbide

Due to its superior mechanical features carbide is used in a variety of applications. KYOCERA produces a variety of carbides, including KW10 and GW15 for non-ferrous materials and micro-grain carbides for precision cutting.

Features

- Tough and hard
- Good thermal conductivity
- Suitable for cutting non-ferrous metals and non-metals
- Stable cutting at low cutting speeds, including drilling operations

Features of Carbide

Workpiece Material	Symbol	Color	Main Component	Advantages
 Non-ferrous materials	KW10	Gray	WC+Co	<ul style="list-style-type: none"> ISO identification symbol K carbide (K10 relevant) Application: Stable cutting of cast iron, non-ferrous materials and non-metals
	GW15	Gray	WC+Co	<ul style="list-style-type: none"> ISO identification symbol K carbide (equivalent to K10), tough micro-grain carbide Application: High wear resistance and toughness for cast iron, non-ferrous materials and non-metals

Magic Drill DRZ

- Single insert in both pockets and four cutting edges per insert promotes cost savings and increased efficiency
- Molded chipbreaker produces three separate chips for smooth chip evacuation
- Inserts available in new MEGACOAT PVD coated carbides for a variety of applications
- Able to offset drill and drill into slant workpieces without pre-drilling
- Excellent surface finishes

The same insert is used in both the inner and outer pockets

Chips are divided into a total of 3 pcs: 2 pcs from the outer edge and 1 pc from the inner edge.

Silver Nickel Coating

- Promotes tool life
- Improves chip flow

• Standard chipbreakers (without symbol) may function better with interrupted cutting.

★ : 1st Recommendation ☆ : 2nd Recommendation

• When machining aluminum, chips become long and difficult to discharge at depths over 2D.

Inserts are sold in 10 piece boxes

Magic Drill DRX

Drilling

Magic Drill DRX

- New 5xD inch-size offering
- New twisted coolant hole technology for improved chip evacuation
- Three new chipbreakers for a variety of workpiece materials
- New MEGACOAT insert grades cover a variety of applications
- Balanced cutting system for precision drilling and excellent surface finishes
- New Technology: Twisted Coolant Holes

Magic Drill DRX

Drilling

Twisted Coolant Hole technology design provides

Superior Chip Evacuation

The flute space of the internal cutting edge side is 1.6 times larger than the DRZ style drill, providing increased chip evacuation

The coolant performance has 1.25 times more volume than the DRZ style drill

The special alloy provides tool holder rigidity and increased reliability

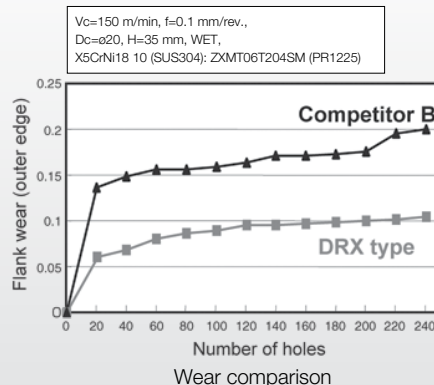

■ Three New MEGACOAT Insert Grades

(PR1230: for Steel, PR1225: for Stainless Steel / Low Carbon Steel, PR1210: for Cast Iron)

MEGACOAT Coating Technology provides longer and more stable tool life

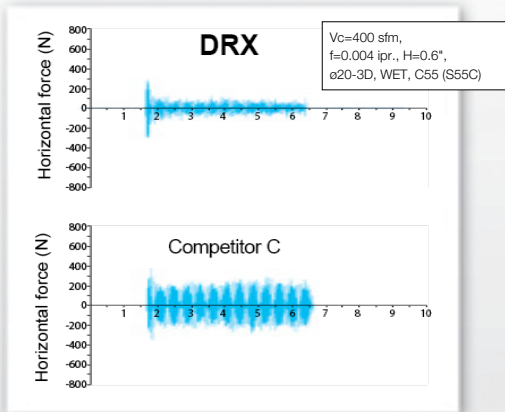

MEGACOAT achieves better wear resistance than competitor B achieving longer tool life

Balanced Cutting System

Vibration comparison

Less vibration due to balanced cutting system

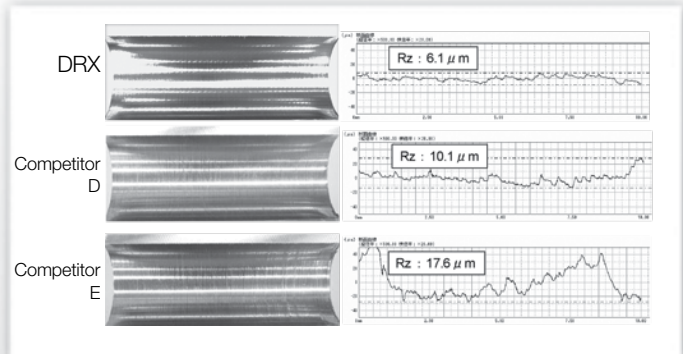

Better surface finish

Variation of drilling diameter

Surface finish comparison

$V_c=600 \text{ sfm}$, $f=0.006 \text{ ipr}$, $H=2.4''$ (through hole),
 $\phi 20\text{-}3\text{D}$, WET, C45 (S45C), NC Lathe

Better surface finish than Competitor D and E

$V_c=180\text{m/min}$, $f=0.08\text{mm/rev.}$, $H=56\text{mm}$ (blind hole),
 $\phi 14\text{-}4\text{D}$, WET, C50

Compared to competitor F, the DRX's excellent chip evacuation performance provides good balance and less variation in cutting dia. drastically improving straight machining capability

New chipbreaker design covers a variety of workplace materials

New chipbreaker features

$V_c=120\text{m/min}$, $f=0.1\text{mm/rev.}$, $H=15\text{mm}$, $\phi 20\text{-}3\text{D}$, WET, C55 (S55C)

Cutting force comparison of outer edge at the start of drilling

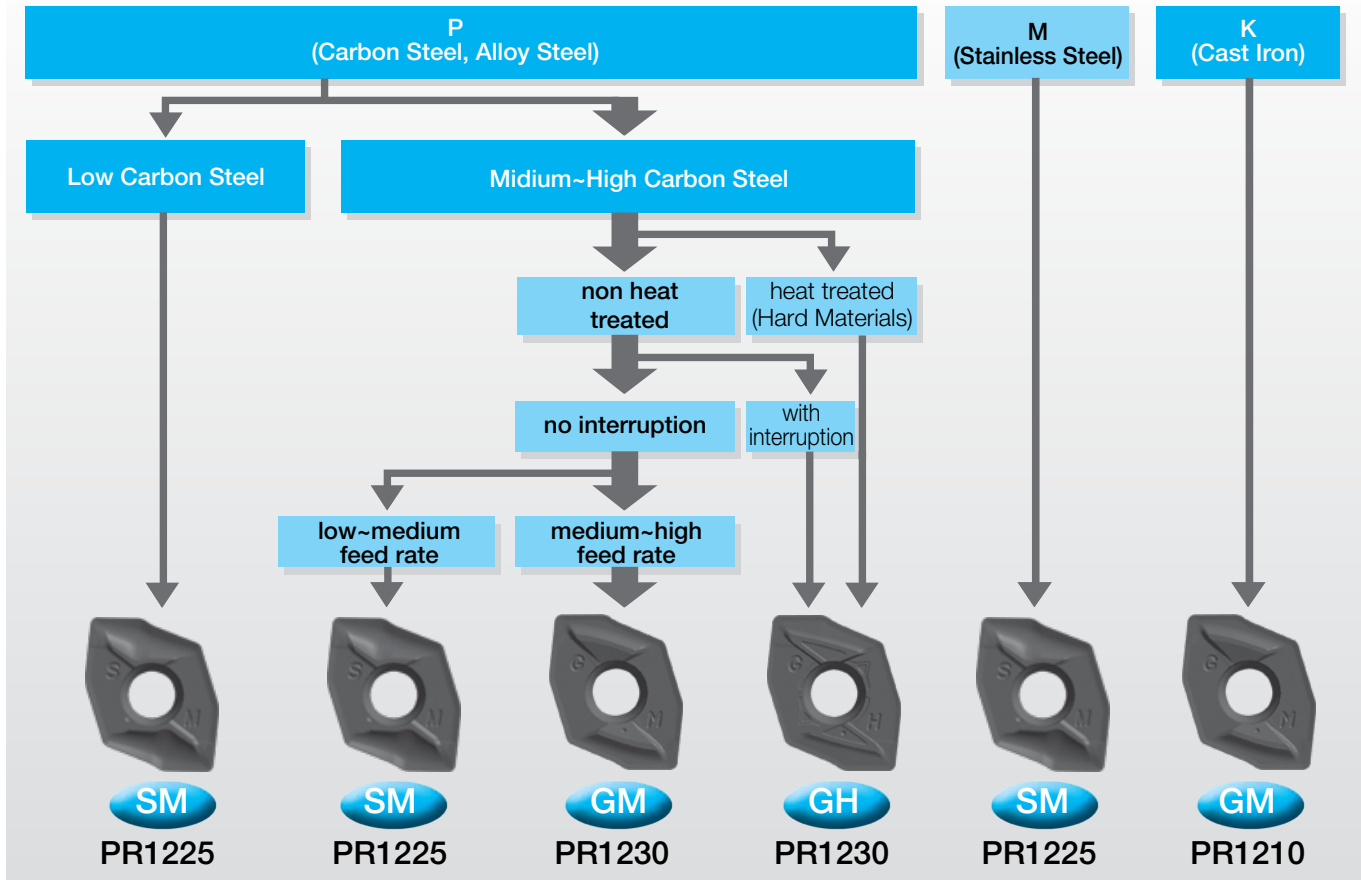

Lowered impact force at the start

Reduces sudden breakage

Chipbreaker Selection

Magic Drill DRX

Drilling

Three chipbreakers for a variety of materials

◆ GM Chipbreaker...General Cutting

For Steel: PR1230 For Cast Iron: PR1210

① Wider chipbreaker can cover a variety of materials

② Achieves good balance of cutting edge strength and sharp cutting

For general cutting

Optimized cutting edge strength, sharpness and chip control

◆ GH Chipbreaker...Tough Edge

For hard materials, interrupted machining: PR1230

② Cutting edge strength oriented design

1st recommended chipbreaker for hard materials & interrupted operations

Cutting edge strength oriented design of chipbreaker

① Wider chipbreaker control breakage by pressed chips

Interrupted drilling by displacing center of hole by 8mm

• Chipping resistance comparison

Vc=260 sfm, f=0.003 ipr, H=0.39", Dc=ø.79", 3D type, WET, C50 (S50C)

Better chipping resistance than competitors

◆ SM Chipbreaker...Sharp Cutting for Deeper Drilling

For Stainless Steel, Low Carbon Steel: PR1225

② Sharp cutting by large rake angle

① U-shaped cutting edge breaks chips by growing cracks from both ends

Outstanding chip control achieved by splitting chips from the outer edges

For deep drilling of difficult to control chips materials such as stainless steel and low carbon steel

Sharp cutting by large rake angle
Stable chip control by newly designed chipbreaker and U-shaped cutting edge

Chip breaking system of SM chipbreaker (Outer edge)

How to select ZXMT03

ZXMT03 type (Cutting Dia.: Ø12~Ø13)

- For outer edge, please select "E" insert from three different chipbreakers for each application.
- For inner edge, please select "I" insert (GM chipbreaker only).

Advantages of the Chipbreaker

Chipbreaker		GM	GH	SM
Insert				
Advantages		1st. recommendation for carbon steel and alloy steel, 1st. recommendation for cast iron.	1st. recommendation for interrupted machining and hard materials. Cutting edge strength oriented design.	Suitable for sticky materials such as stainless steel and low carbon steel
		Good balance of sharp cutting and cutting edge strength	Middle to high feed rates of steel machining, GM Chipbreaker alternative	Sharp cutting, prevents chattering. For low to medium feed rates of steel.
Outer edge	Chipbreaker Cross-section			
	Chips from Outer edge			
Inner edge	Chipbreaker Cross-section			
	Chips from Inner edge			
Workpiece Material		S50C	S50C	SUS304

Indication of tool life of Magic Drill

How to judge tool life	Indication of judging tool life
Judgement of tool condition and insert wear	When an insert is new the holder is slightly bent to the side during cutting. (Therefore, the cutting diameter is slightly bigger during cutting). Once cutting is finished, the holder will return back to normal size. No tool marks will appear on the finished surface. (Although this depends on workpiece and cutting condition: during external machining slight tool mark might appear.)
	When an insert is at the end of its tool life, Gradually the external corner part gets worn out, the holder does not bend slightly outwards - it starts to bend inwards. After the cutting is finished, the holder returns to the normal position. When taking off a holder under this condition the cutting edge of the insert creates external tool marks on the finished surface of the workpiece.
Checking cutting diameter	When cutting diameter is measured, suddenly it shows small diameter. In this case, a worn out insert can be the cause.
Checking the surface on the exit side	If insert wear progresses, the burrs of penetrated hole entrance becomes bigger. This is a clear indication that the tool must be exchanged.
Variation of cutting noise	Light cutting noise at the beginning turns to brady noise which contains vibration noise.
Variation of vibration	As the end of tool life is getting closer, there is more vibration and the cutting noise changes. However, when machining smaller diameters these factors are difficult to detect.

DRX (Drilling Depth : 5 x D) Inch Diameter

How to select ZXMT03

ZXMT03 type (Cutting Dia : $\phi 12 \sim \phi 13$)

- For outer edge, please select "-E" insert from three different chipbreakers for each application.
- For inner edge, please select "-I" insert (GM chipbreaker only).

• Outer edge

ZXMT030203OO-E

GM-E GH-E SM-E

• Inner Edge

ZXMT030203GM-I

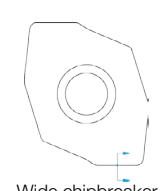

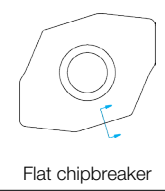

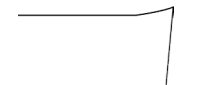

GM-I

Magic Drill DRX

Drilling

Features of the Magic Drill DRX Chipbreakers

Chipbreaker			GM	GH	SM
Insert					
Advantages			1st. recommendation for carbon steel and alloy steel, 1st. recommendation for cast iron.	1st. recommendation for interrupted machining and hard materials. Cutting edge strength oriented design.	Suitable for sticky materials such as stainless steel and low carbon steel
			Good balance of sharp cutting and cutting edge strength.	Middle to high feed rates of steel machining, GM Chipbreaker alternative.	Sharp cutting, prevents chattering. For low to medium feed rates of steel.
Outer edge	 Wide chipbreaker	Cross-section			
		Chips from Outer edge			
Inner edge	 Flat chipbreaker	Cross-section			
		Chips from Inner edge			
Workpiece Materials			C50 (S50C)	C50 (S50C)	X5CrNi18 10 (SUS304)

High efficiency

High feed rate

High reliability

High quality

Four unique characteristics of the DRC Magic Drill improve productivity and reduce costs through high speed and high feed rate machining.

1. Self-Clamping design

- The clamp rigidity and resistance of the DRC Magic Drill's self-clamping method has significantly improved with the new design analysis and material technology.
- Easy replacement is possible on the machine.

2. Self-Centering design

- The S-curve top shape geometry of the insert known as the "Self-Centering design" enables smooth drilling, lowers cutting forces and produces a high quality surface finish.

3. Multiple Helical Angle Flute design

- Provides superior drill body stiffness and chip evacuation.

4. Direct Cooling design

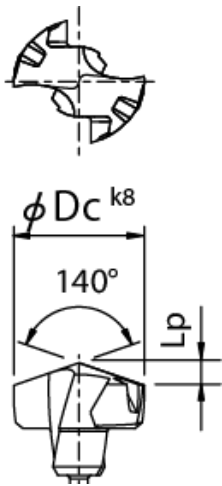

- The coolant is fed directly into the inserts cutting face, cooling the top of the drill and preventing chip adhesion, which allows for quick and smooth chip evacuation.

DC inserts are sold in 1 piece boxes.

● : Stock Standard
○ : World Express

● Insert grade PR0315

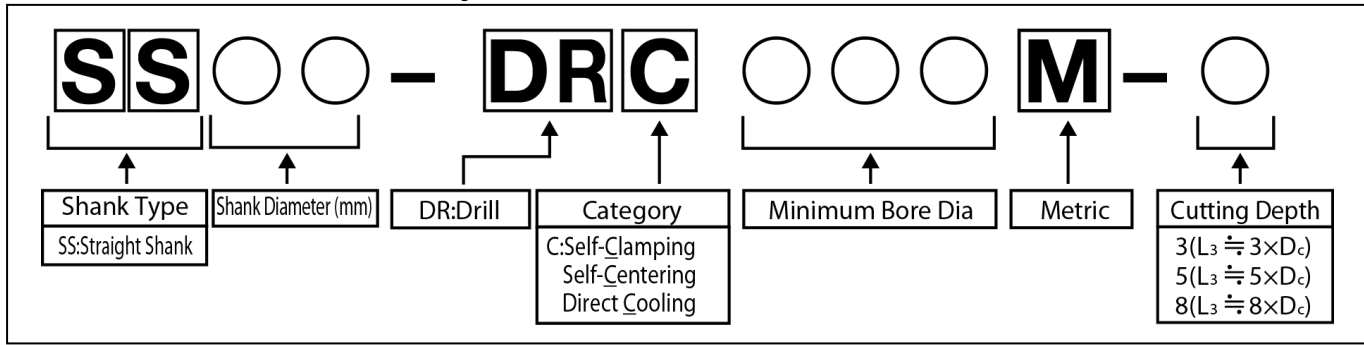

PR0315 is a tough super micro grain carbide grade with TiAlN coating, providing excellent wear resistance and fracture resistance. It enables stable machining of carbon steel, alloy steel and cast iron.

● Method to use DRC chamfering attachment

1. Drilling depth adjustment

- Insert drill into chamfering attachment.
- Next, temporarily attach the chamfering insert A.
- Turn the adjusting screw (1) with the hexagon wrench (4) to set the drilling depth T.

2. Drill location check

- Rotate the drill so that the lower end of the chamfering insert A is aligned with the body clearance B of the drill.
- Set it so that slot C and the drill fitting screws (2) are lined up as shown in the figure above.

3. Fix the drill

- Tighten the drill fitting screws (2) with the hexagon wrench (4). (In the case of using a torque wrench, then please refer to the table below.)

4. Installation of the chamfering insert

- Press the chamfering insert A lightly into the drill and tighten the insert mounting screw (3) with wrench (5).

Wrench for Installing Inserts

Shape		Description	Dimension(inch)			Remarks
			A	B	C	
		WDCR8	1.69	1.30	Ø0.402	
		WDCR10			Ø0.480	
		WDCR12			Ø0.559	
		WDCR14			Ø0.677	
		WDCR17	3.03	2.05	-	<ul style="list-style-type: none"> •WDCR17(Multiple type wrench) has four insert entry points. If using an insert ranging from DC06692-SC to DC08264-SC, use the entry point printed as Ø0.6692"~Ø0.8264". •WDCR17 can be used instead of WDCR8~14 wrench.

Method to change DRC Type Magic Drill Inserts

How to Attach Inserts

- 1) Fix drill holder on arbor. For insert exchange, fix arbor on the machine or set on tool presetter.
- 2) Remove dust using air blower.

- 3) Install insert onto holder.
(Use gloves to protect your hand from any danger.)

- 4) Turn lightly in a clockwise direction.
(Use gloves to protect your hand from any danger.)

- 5) Align the wrench properly with the insert.

- 6) Make sure the wrench is aligned with the wrench slots on the insert.

(Improper alignment shown)

Slot for wrench

- 7) Turn the wrench in a slow clockwise direction.
- 8) Completed.

How to Detach Inserts

- 1) Remove dust from insert using air blower.
- 2) Align the wrench properly with the insert.

- 3) Make sure the wrench is aligned with the wrench slots on the insert.

- 4) Turn the wrench in a counterclockwise direction.

- 5) Once lock is released, insert can be turned by fingers.
(Use gloves to protect your hand from any danger.)

- 6) Remove insert.
(Use gloves to protect your hand from any danger.)

Coolant

- 1) Internal coolant is recommended.

- 2) In case of external coolant
Cutting depth must be 3xD or less.

- 3) Dry cutting is not recommended.

Magic Drill DRC

Precautions for Use

Core Deviation

1) If drill is stationary

The max runout between the drill and spindle should not exceed 0.0008.

2) If drill is rotating

The max runout allowable on the drill is 0.0008

Magic Drill DRC

Drilling

Applicable Workpieces

Application	Workpiece Shape	Caution for machining
Flat Face		<ol style="list-style-type: none"> Due to good chip control, peck drilling is not necessary for soft steel like 1015. When machining 304, for hole depths of more than 2.5D, utilize the step machining process. In order to have smooth chip removal, we recommend internal coolant.
Stacked Plates		<ol style="list-style-type: none"> Fix stacked plates securely to ensure they do not slip while machining.
Hole Expansion		<ol style="list-style-type: none"> If the overlap amount is less than $1/3 \times D$, machining is possible.
Concave Surface		<ol style="list-style-type: none"> When machining concave holes set the feed rates at half or less than continuous hole machining.
Pipe Material		<ol style="list-style-type: none"> Hole machining above the centerline of the pipe is possible. Do not machine on curved surface areas.

Not Recommended Workpieces

Case Studies

1049	
<ul style="list-style-type: none"> Flange $V_c=97\text{m/min}$ ($n=2,490\text{min}^{-1}$) $H=32\text{mm}$ $f=0.3\text{mm/rev}$ ($V_f=747\text{mm/min}$) Wet(Internal Coolant) DC1250M-SC (PR0315) 	
SS14-DRC120M-3	3,000holes/insert
Competitor A	1,800holes/drill
<p>Compared to competitor's drill A, MagicDrill DRC type has reduced burr and reduced more than 10% of the power required. Tool life has also improved greatly.</p> <p style="text-align: right;">Customer Evaluation</p>	

4140	
<ul style="list-style-type: none"> Housing $V_c=83\text{m/min}$ ($n=2,400\text{min}^{-1}$) $H=32\text{mm}$ $f=0.24\text{mm/rev}$ ($V_f=576\text{mm/min}$) Wet(Internal Coolant) DC1100M-SC(PR0315) 	
SS12-DRC110M-3	more than 2,400holes/insert
Competitor B	2,000holes/drill
<p>Compared to competitor's solid drill B, MagicDrill DRC type has greatly reduced preparation time with its easy insert replacement feature. Also, the costs of spare tools for re-grinding has been reduced, and tool life has improved.</p> <p style="text-align: right;">Customer Evaluation</p>	

Q&A

Q-1 Is re-grinding available?

A-1 We don't recommend it. Grinding of edge nose chisel is not possible.

Q-2 How large would the cutting hole be to the insert diameter (φDc)?

A-2 When drilling 4137, the hole diameter will be about 0.020 to 0.040 larger than the insert diameter.

Magic Drill DRS

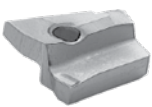

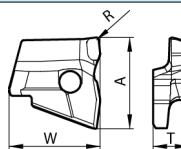

Magic Drill DRS

Drilling

- 10mm diameter drilling with an indexable insert
- Inner & outer edges on one insert makes replacement easy
- Small chips with good chip evacuation
- High-speed stable machining for high efficiency
- Productivity improvement and significant cost reduction
- Possible to drill into a slant face without pre-drilling

DRS Recommended Cutting Conditions

Workpiece Material	Recommended Grade (sfm)			Feed Rate (ipr)
	MEGACOAT		PVD Coated Carbide	
	PR1230	PR1210	PR660	
Low Carbon Steel	★ 270~330	-	☆ 270~330	.0024
Carbon Steel	★ 270~330	-	☆ 270~330	.003~.004
Alloy Steel	★ 270	-	☆ 270	.0016~.0024
Mold Steel	★ 270	-	☆ 270	.0016~.0024
Stainless Steel (Austenitic related)	★ 230~270	-	☆ 230~270	.002~.0024
Gray Cast Iron	-	★ 80~100	-	.003~.004

- Apply a sufficient amount of coolant.
- If cutting speed is decreased too much from above condition, chip evacuation will deteriorate.
If the feed rate is increased too much from above condition, inner edge chip evacuation will deteriorate.
If the feed rate is decreased too much from above condition, outer edge chip evacuation will deteriorate.
- If chips become long and are entangled with the tool when low carbon steel cutting, increase the cutting speed to 400-500 SFM.
If this doesn't solve the problem, try peck feeding.
[How to peck feed]
(1)Cut .04-.08 in (2)Return .004 in (3)Repeat (1)and (2)

Holeshot Drills

Magic Drill DR

Drilling

- Drilling diameters from 0.688" to 4.000"
- Flute designs optimized for maximum rigidity and good chip evacuation
- WCMX inserts available in new MEGACOAT Grade PR1230

Patented Swept Back Design

- Enables drilling of stacked plates and welded assemblies
- Reduces slug formation
- Provides excellent chip control

● WCMX...M1 : General purpose drilling insert; First choice for Med-High Carbon Steel, Tool Steels, and Cast Iron; also available for General purpose drilling in Stainless Steel. Tougher edge than M1A chipbreaker.

● WCMX...M1A: First choice for Low-carbon Steel, Aluminum, and other "sticky" materials. Freer cutting than M1 chipbreaker.

Magic Drill DR

Drilling

Coremaster Coredrills

Coremaster
Coredrill

Drilling

- Fast effective way to expand pre-existing holes
- Two effective flutes allow high feed rates for improved productivity
- WCMX inserts available in new MEGACOAT Grade PR1230
- Deeper drilling depths available in the XL Series

Coremaster Coredrill
Available in Both
FIXED POCKET
and
ADJUSTABLE CARTRIDGE

Adjustable cartridges can be adjusted 0.075" per side, providing 0.150" adjustment capability on diameter

● Coremaster Coredrill Inserts

Fine Micro Drills

Fine Micro Drills

Advantages

1. Kyocera's precise grinding technology produces high quality cutting edge with minimized variability
2. A tougher ultra-micro grain carbide substrate improved cutting edge stability and anti-breakage performance
3. Ultra-thin high performance coating layer (FS Coating) enables high efficient and long lasting drilling application.

"FS coating", FS stands for Fine Surface; it is Kyocera's unique coating technology which shows great performance in sharpness and chip flow due to its excellent smooth surface with low friction coefficient and superior wear resistance

How to Read Product Descriptions (Drills are sold in 10-pc packs or 1-pc packs)

10-piece packs	FDM - ○○○○ <u>FSA</u> Drill Dia. Grade No indication means item sold in 10-piece pack
1-piece packs	FDM - ○○○○ (1) <u>FSA</u> Drill Dia. (1) Grade Indicates 1-piece pack

Recommended Drilling Condition

Custom order

Available for custom order

- ① Drilling diameter (Ø0.1~0.8mm)
- ② Diameter tolerance
- ③ Cutting edge length
- ④ Shank diameter Ø3.0/Ø3.175
- ⑤ Coating: FSA/A

Quick delivery for minor modification such as changing edge length.

Contact us for other modification request for tip angle, helix angle and others.

Recommended Drilling Conditions

(mm)	Carbon steel, alloy steel		Stainless Steel		Cast Iron		Aluminum, Alloy Steel	
	(m/min)	(mm/rev)	(m/min)	(mm/rev)	(m/min)	(mm/rev)	(m/min)	(mm/rev)
0.10~0.19	2~6	0.0005~0.002	2~6	0.0003~0.001	2~10	0.0005~0.003	4~15	0.0005~0.003
0.20~0.29	4~10	0.001~0.004	4~10	0.0005~0.002	5~15	0.001~0.005	10~20	0.001~0.005
0.30~0.50	6~15	0.002~0.010	6~10	0.001~0.005	10~20	0.004~0.015	15~30	0.004~0.015
0.60~0.80	8~24	0.004~0.015	8~15	0.002~0.007	10~30	0.005~0.020	20~45	0.005~0.020

Notes:

- Above conditions varies depending on work piece hardness and machine conditions
- Use coolant, water-insoluble recommended.
- Use higher precision chuck and minimize overhang length
- Recommend step feeding in case drilling 3 times or more depth of drill diameter
- Recommend depth per step is 10% to 50% of drill diameter, Take shorter step for deeper depth.

• Dia. adjustment range refers to the cutting diameter.

• ASL and SHE are only to be used with the Magic Drill (DRX, DRZ-type). Not recommended for the small dia. Magic Drill (DRS-type) because the adjustment range is too large.

1. Diameter Adjustment –For Machining Center–

• Diameter Adjustment Range (ASL=inch)

Shank Dia.	Cutting Dia.	Range

SHEM for Magic Drill DRS

Diameter Adjustment

Sleeve Dimensions

Description	Stock	Dimension							Dia. Adjustment Range (mm)
		Ød	ØD1	ØD2	L1	L2	L3	L4	
SHEM 2025-43	○	20	25	41	43	4	36	3.0	+0.1, -0.1
2032-43	○	20	32	49	43	6	36	2.5	+0.1, -0.1

• Dia. Adjustment Range adjusts the cutting diameter.

How to Use

- SHEM is designed for only the Small Diameter Magic Drill.
 - SHEM is for cutting diameter adjustment only. (up to +0.1mm or -0.1mm)
 - SHEM is not for center height adjustment like conventional adjustable sleeve (SHE-type).
 - Apply SHEM when adjusting the cutting diameter for pre-drilling before threading.
- ① Set the outer edge horizontally: 90° to the marking line on the sleeve (Fig.1)
 - ② To adjust to a larger diameter, align the +0.1 mark on the sleeve with the flat on the drill shank. To adjust to a smaller diameter, align the -0.1 mark on the sleeve with the flat on the drill shank.
 - ③ Tighten the bottom screw firmly which is directly touching the drill. Slightly tighten the upper screw which is directly touching the sleeve.

Fig.1 Diameter Adjustment Method (e.g.) φ10 Drill

Caution: Not for use with Collet Chuck type Arbor

Customized Drill Ordering Procedure

To request a quote for a custom drill, please follow the steps below:

1. Photocopy and fill out the Special Tool Design Worksheet on adjacent page.
2. Fax the completed form along with any necessary prints and drawings to the Kyocera Quotations Department at 828-692-1344.
3. Contact the Kyocera Quotations Department at 800-823-7284 with any questions regarding the custom drill quotation procedure.

Fillets, inside corner radii (insert nose radii)

Allowable overtravel on thru cuts

Amount of finish stock to leave

■ Technical Information Contents

The technical section of this catalog is intended to provide sufficient basic information to apply indexable cutting tools, specifically Kyocera products. The majority of requests for technical support that Kyocera receives are for speeds and feeds. If you need technical help beyond what is contained in this section, contact our technical staff at 800-823-7284.

Drilling & Core Drilling Basic Formulas 98

Drilling Troubleshooting 99

■ Drilling Basics

Proper drilling involves proper machine setup, coolant delivery, insert selection, and a basic understanding of the drilling process. Indexable drills are not the same as twist drills in application or performance.

BASIC DRILLING

Drilling a hole from solid stock is a tough job for a variety of reasons. Chip and heat evacuation are tough, the actual cutting action is hidden from view, and the surface footage varies from the programmed speed at the outer cutting edge to zero at the center of the tool. A drill doesn't actually cut at the center, it pushes the material out of the way. Cutting forces are high and other factors such as coolant delivery and machine alignment can combine to cause a drill to deflect and cut off-size, or fail catastrophically.

MACHINE SETUP

This is an important consideration when using indexable drills. In drilling, shorter is always better. Use the shortest drill and the shortest adapter possible. This will always improve performance. The machine spindle and bearings should be in good condition, and the fixturing must be adequate and rigid.

In lathes, **alignment is crucial**. The tool must run within 0.003" TIR to the spindle, or insert failure could occur. **If the center insert continually chips, check the alignment**. Chuck jaws should be in good condition as well and provide adequate clamping pressure. The workpiece should not extend from the chuck excessively either.

COOLANT DELIVERY

Coolant thru-the-spindle should be used wherever possible. Coolant improves tool life by lubricating the cut and removing heat and chips from the work area. Chip evacuation is very important when drilling.

INDEXABLE VS. TWIST DRILLS

Indexable drills are very different than twist drills. Replaceable inserts eliminate drill regrinding. Because of higher surface footages, indexable drills generally out-feed twist drills.

DRILLS VS. CORE DRILLS

Kyocera drills are designed to put holes in solid material. Kyocera core drills are used to open a pre-existing hole. Core drills, because of their design, can attain two times the feed rate of insert drills. As a result, core drills provide an excellent means of enlarging an existing hole.

APPLICATION CONSIDERATIONS

Feed and Speeds

Proper cutting speeds and feeds are obviously important considerations. The recommended cutting feed and speeds shown in this section are starting points derived through testing in our Tech Center and in the field. Adjustments are frequently required for optimum results based on specific application configurations. Call your local Kyocera Sales Engineer for assistance as necessary.

Rigid Setups

No tool will perform at maximum potential in a poor setup. Workpieces must be held securely and in accurate alignment (.XXX or less for non-DRC drills and .XXXX for DRC drills).

Tombstones must be mounted properly, and workholding must be adequate. Worn jaws can introduce chatter, and possibly mislocate parts, or even release parts during the cut. The machine itself must be in good condition, and **tool gage lengths should be as short as possible**. Shorter gage lengths result in higher feed capabilities with less deflection and chatter, and longer insert life.

Machine Horsepower vs. Spindle Horsepower

There can be a great difference between the spindle motor rating (machine horsepower) and the horsepower at the tool tip (spindle horsepower). Typically, spindle horsepower is around 75% of rated horsepower. As a good rule of thumb, drills require approximately 5hp per inch of diameter when cutting steel. The machine's power curve should be referenced to determine the power available at various speeds in order to determine capability.

Magic Drill Set-Up for Lathes

■ Installation

- ① The top face of the outer insert should be parallel to the X-axis to allow for offset cutting.
- ② It is recommended to set the outer insert as shown in Fig. 1 with the outer insert facing the operator. (It is also possible to use it by setting 180° reverse position.) In case of the lathe with two turrets, when installing the drill to the lower turret, the outer insert should be set so as to face the operator. (It is also possible to use it by setting at 180° reverse position)

Fig.1 Installation to the Turning Lathe

■ Cutting Diameter Adjustment

1. Cutting Diameter Adjustment

- ① Cutting diameter is adjusted by moving the tool in the X-axis direction. The moving direction of the X-axis movement depends on the position of the toolholder.
- ② For making the hole diameter larger, slide the tool along the X-axis toward the outer insert side. (Fig. 2, Fig. 3) For making the hole diameter smaller, slide the tool along the X-axis in the opposite direction. (This movement of the axis is called "Offset") However, be sure not to make the hole diameter smaller than the drill diameter by 0.2mm (.008") or more. Otherwise, the toolholder will interfere with the drilled hole. (Fig. 4) e.g.) when using $\varnothing 20$ ($\varnothing .787$ ") drill, the hole diameter must not be smaller than 19.8mm (.780") .

2. Offset Limit of the Cutting Diameter

For the maximum limit of the cutting diameter, refer to "Max. Offset (Radial)" in the Toolholder Dimension table. (The figure in the table shows how much it is possible the offset the drill in the radial direction.) e.g.) In case of using $\varnothing 20$ ($\varnothing .787$ ") drill, it is possible to make a hole up to $\varnothing 2$ ($\varnothing .827$ ") 1 since "Max. Offset (Radial)" is +0.5mm (.02") .

Fig. 2 Outer Insert Facing Up

Fig. 3 Outer Insert Facing Down

■ Center Height Adjustment

1. Center Height of the Inner Insert

When installing inner insert as shown in Fig. 1, it will be set around 0.2mm (.008") below the Center line of the Spindle. (Fig. 5) This is the normal position of the center height and the inner insert is designed to be set at this position. However, in case that the turret of the lathe is out of alignment, sometimes the inner insert may be above, or excessively below the center. For stable machining, it is essential to check the center height of the inner insert carefully.

Fig. 5 Front View of the Drill

2. How to Check the Center Height of Inner Insert

For checking the center height of the inner insert, see the core which remains at the center of the drilled hole. (Fig. 6) If the center height is in the normal condition, a core of about 0.5mm (.02") in diameter will remain after machining.

In the following case, it is necessary to adjust the center height.

- No core remains
- Core diameter is more than 1mm (.04")

For test cutting to check the center height, drill a shallow hole about 10mm (.40") in depth at low feed rate of less than 0.1mm/rev (.004ipr) .

Fig. 6 Center Core

3. Center Height Adjustment

a) No Core or Cores with Small Diameter

This occurs when the inner insert is on or above the center.
In this case, adjustment is necessary since insert breakage is likely at the center of the drill. (Fig. 7)

Fig. 7 Insert Breakage near the Center of Drill

Adjustments

① Install the drill rotated at the 180°. Most problems will be solved by this method.

② If the core diameter becomes too large after the above adjustment, install the drill rotating 90° counter-clockwise as shown in Fig.9 (outer insert is positioned lower) and adjust the center height by moving the tool in the X-axis direction.

(However, this makes it impossible to adjust the cutting diameter.)

Caution: In case of installing the drill in the opposite direction (outer insert is positioned upper), the cutting diameter will become smaller, which may cause the drill body to interfere with the drilled hole.

The fundamental solution is to readjust the center position of the turret itself.

Fig. 8

Fig. 9

b) Core with Excessively Large Diameter (More than 1mm/.04")

This occurs when the inner insert is excessively below the center.
This condition causes poor chip evacuation and on adjustment is required.

Adjustments

Install the drill rotating 90° counter-clockwise as shown in Fig.10 (outer insert is positioned upper), and adjust the center height by moving the tool in the X-axis direction.

(However, this makes it impossible to adjust the cutting diameter.)

Caution: When installing the drill in the opposite direction (outer insert is positioned lower), the cutting diameter will become smaller, which may cause the drill body to interfere with the drilled hole.

The fundamental solution is to readjust the center position of the turret itself.

Fig. 10

■ How to select ZXMT03

ZXMT03 type (Cutting Dia : $\phi 12 \sim \phi 13$)

- 1) For outer edge, please select "-E" insert from three different chipbreakers for each application.
- 2) For inner edge, please select "-I" insert (GM chipbreaker only).

•Outer edge

ZXMT030203OO-E

GM-E GH-E SM-E

•Inner Edge

ZXMT030203GM-I

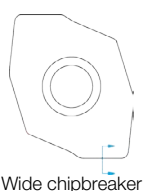

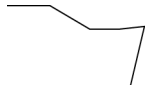

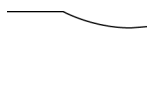

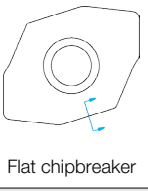

GM-I

■ Features of the Magic Drill (DRX) Chipbreakers

Chipbreaker			GM	GH	SM
Insert					
Advantages			1st. recommendation for carbon steel and alloy steel, 1st. recommendation for cast iron.	1st. recommendation for interrupted machining and hard materials. Cutting edge strength oriented design.	Suitable for sticky materials such as stainless steel and low carbon steel
			Good balance of sharp cutting and cutting edge strength	Middle to high feed rates of steel machining, GM Chipbreaker alternative	Sharp cutting, prevents chattering. For low to medium feed rates of steel.
Outer edge		Cross-section			
	Wide chipbreaker	Chips from Outer edge			
Inner edge		Cross-section			
	Flat chipbreaker	Chips from Inner edge			
Workpiece Materials			C50 (S50C)	C50 (S50C)	X5CrNi18 10 (SUS304)

■ Wrench for Installing Inserts

Shape		Description	Dimension (inch)			Remarks
			A	B	C	
		WDCR8	1.69	1.30	Ø0.402	 <p>Description is printed in this area.</p>
		WDCR10			Ø0.480	
		WDCR12			Ø0.559	
		WDCR14			Ø0.677	
		WDCR17	3.03	2.05	-	<ul style="list-style-type: none"> •WDCR17(Multiple type wrench) has four insert entry points. If using an insert ranging from DC06692-SC to DC08264-SC, use the entry point printed as Ø0.6692"~Ø0.8264". •WDCR17 can be used instead of WDCR8~14 wrench.

Method to change DRC Type Magic Drill Inserts

● How to Attach Inserts

- 1) Fix drill holder on arbor. For insert exchange, fix arbor on the machine or set on tool presetter.
- 2) Remove dust using air blower.

- 3) Install insert onto holder.
(Use gloves to protect your hand from any danger.)

- 4) Turn lightly in a clockwise direction.
(Use gloves to protect your hand from any danger.)

- 5) Align the wrench properly with the insert.

- 6) Make sure the wrench is aligned with the wrench slots on the insert.

- 7) Turn the wrench in a slow clockwise direction.
- 8) Completed.

● How to Detach Inserts

- 1) Remove dust from insert using air blower.
- 2) Align the wrench properly with the insert.

- 3) Make sure the wrench is aligned with the wrench slots on the insert.

- 4) Turn the wrench in a counterclockwise direction.

- 5) Once lock is released, insert can be turned by fingers.
(Use gloves to protect your hand from any danger.)

- 6) Remove insert.
(Use gloves to protect your hand from any danger.)

■ Coolant

- 1) Internal coolant is recommended.

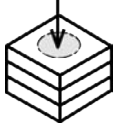

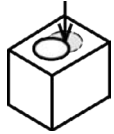

- 2) In case of external coolant
Cutting depth must be 3xD or less.

- 3) Dry cutting is not recommended.

Applicable Workpieces

Application	Workpiece Shape	Caution for machining
Flat Face		<ol style="list-style-type: none"> 1. Due to good chip control, peck drilling is not necessary for soft steel like 1015. 2. When machining 304, for hole depths of more than 2.5D, utilize the step machining process. 3. In order to have smooth chip removal, we recommend internal coolant.
Stacked Plates		<ol style="list-style-type: none"> 1. Fix stacked plates securely to ensure they do not slip while machining.
Hole Expansion		<ol style="list-style-type: none"> 1. If the overlap amount is less than $1/3 \times D$, machining is possible.
Concave Surface		<ol style="list-style-type: none"> 1. When machining concave holes set the feed rates at half or less than continuous hole machining.
Pipe Material		<ol style="list-style-type: none"> 1. Hole machining above the centerline of the pipe is possible. 2. Do not machine on curved surface areas.

Precautions for Use

Core Deviation

1) If drill is stationary

The max runout between the drill and spindle should not exceed 0.0008.

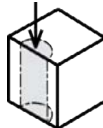

2) If drill is rotating

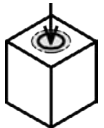

The max runout allowable on the drill is 0.0008

Q&A

Q-1 Is re-grinding available?

A-1 We don't recommend it. Grinding of edge nose chisel is not possible.

Q-2 How large would the cutting hole be to the insert diameter (ϕD_c)?

A-2 When drilling 4137, the hole diameter will be about 0.020 to 0.040 larger than the insert diameter.

■ Holeshot Drill (DR) Applications

DRILL APPLICATION HOLESHOT INDEXABLE DRILL

STATIONARY

For stationary (lathe) applications the drill should be mounted in a toolholder that is concentric within 0.003 TIR and parallel to the machine centerline. Flats on the shank should be precisely aligned so that the cutting edges are parallel to the x-axis, which will help chip flow.

A disc is normally produced as the drill breaks through the hole. Although the disc is usually minimal with HOLESHOT, adequate guarding should be provided for and in place.

HOLESHOT drills can be used to back bore an existing hole to a desired size. The drill can be offset by up to 0.015" for back boring.

ROTATING

Make certain the spindle is rigid with minimal runout. Since both machine and fixture rigidity are key factors, make sure the workpiece is fixed rigidly and secured. Mount drill for the least possible overhang and make sure the drill flange is flush against the face of the adapter.

Coolant - Chip removal and tool life are enhanced by feeding coolant through the drill. 30 P.S.I. minimum coolant pressure is recommended for horizontal applications. Vertical position requires a higher coolant pressure (40 to 60 P.S.I.) to flush chips properly.

Through the tool coolant is preferred for HOLESHOT drilling, but due to the unique flute design, coolant deficiencies can be overcome. Especially in smaller, lower horsepower machine tools, strong flood coolant can be utilized with excellent results. When flooding the cut, direct coolant directly into the drilling area.

Drilling

■ Drilling & Core Drilling Basic Formulas

DRILLING

CORE DRILLING

SURFACE SPEED PER MINUTE

$$\text{SFM} = 0.262 \times \text{DIA} \times \text{RPM}$$

REVOLUTIONS PER MINUTE

$$\text{RPM} = \frac{3.82 \times \text{SFM}}{\text{DIA}}$$

FEEDRATE (inches per minute)

$$\text{IPM} = \text{IPR} \times \text{RPM}$$

FEEDRATE (inches per revolution)

$$\text{IPR} = \text{IPT} \times \text{N}$$

METAL REMOVAL RATE (in³ per minute)

$$\text{DRILL: } Q = 3 \times \text{DIA} \times \text{IPR} \times \text{SFM}$$

$$\text{COREDRILL: } Q = 12 \times \text{DOC} \times \text{IPR} \times \text{SFM}$$

HORSEPOWER REQUIRED AT THE SPINDLE

$$\text{HPS} = Q \times \text{UHP}$$

HORSEPOWER REQUIRED AT THE MOTOR

$$\text{HPM} = \frac{\text{HPS}}{\text{EFF}}$$

TIME IN CUT

$$T = \frac{15.7 \times \text{DIA} \times \text{LOC}}{\text{SFM} \times \text{IPR}}$$

or

$$T = \frac{60 \times \text{LOC}}{\text{IPM}}$$

■ Definition of Terms

DIA = DIAMETER OF THE DRILL (INCHES)

DOC = DEPTH OF CUT (INCHES)

EFF = MACHINE EFFICIENCY

HPM = HORSEPOWER AT MOTOR

HPS = HORSEPOWER AT SPINDLE

IPM = FEEDRATE (INCHES PER MINUTE)

IPR = FEEDRATE (INCHES PER REVOLUTION)

IPT = CHIPLOAD (INCHES PER TOOTH)

LOC = LENGTH OF CUT (INCHES)

N = NUMBER OF EFFECTIVE FLUTES

N = 1 FOR DRILLS

N = 2 FOR COREDRILLS

Q = METAL REMOVAL RATE (CUBIC INCHES PER MINUTE)

RPM = REVOLUTIONS PER MINUTE

SFM = SURFACE SPEED (FEET PER MINUTE)

T = TIME (SECONDS)

UHP = UNIT HORSEPOWER (SEE TABLE BELOW)

UNIT HORSEPOWER FACTORS					
Material	Hardness (BHN)	UHP Factor (HP/in ³ /min)	Material	Hardness (BHN)	UHP Factor (HP/in ³ /min)
Aluminum	---	0.25	1050	225	0.80
Brass	---	0.25	4140	275	0.70
Copper	---	0.30	52100	225	0.67
Gray Cast Iron	200	0.33	6150	375	1.30
Nodular Iron	225	0.54	Cast Steel	225	0.62
Inconel 700	330	1.10	Stainless Steel	225	0.73
1020	165	0.58
