

## Hard part turning with CBN

## **Choose the right solution**

Since it was first introduced as a cutting tool material in the 1980s, the use of cubic boron nitride (CBN) has evolved to become a common machining solution. The application areas include hardened steels, cast irons, heat resistant super alloys (HRSA) and powdered metals. These workpiece materials have one thing in common; they are generally recognised as being difficult to machine.

A CBN insert can withstand the high cutting temperatures and forces and still retain its cutting edge. This is why CBN delivers long, consistent tool life and produces components with excellent surface finish.

Sandvik Coromant offers a comprehensive program of unique CBN products for finish turning of case hardened steels. In this brochure you will find the correct grade, geometry and edge preparation for your application. Whatever your component design or surface finish requirements we will deliver high productivity and outstanding quality.

## Did you know...

...that CBN is the second hardest known material in the world; the hardest being diamond. This, in addition to many other extreme properties makes it the ideal cutting tool material for hard, abrasive workpieces. CBN has greater chemical and thermal stability than diamond, which dissolves in iron and has a maximum temperature limit of approximately 700°C (1300°F). In contrast, CBN is chemically inert in ferrous materials and retains its hardness at temperatures in excess of 1000°C (1800°F) which is typical for HPT.

## Choose the right grade

Each CBN grade in our hard part turning range has been specifically designed for high performance in finish turning of case hardened steels.

- CB7015 for continuous to light interrupted cutting
- · CB7025 for light to medium interrupted cutting
- CB7525 for heavy interrupted cutting

In order to select the most suitable grade, you must determine what type of cutting best describes your application. In the following pages we guide you through our CBN product range to find the best solution for your process.

## What is hard part turning?

Using a very broad definition hard part turning refers to hardened steels at 55 HRC and above. There are many different types of steel (carbon steels, alloy steels, tool steels, bearing steels etc.) that can achive these high levels of hardness. The common hardening methods are case hardening, induction hardening and through hardening. Hard part turning is usually a finishing or semi-finishing process with high dimensional accuracy and surface quality requirements.

### **Application areas**

The illustration below helps you find the right grade for your application and relates to grade toughness and cutting speed capability.

### CB7015

CB7015 contains 50% CBN with fine grain size in a unique ceramic binder. Maximum performance is achieved in continuous to light interrupted cutting where machine conditions are very stable. CB7015 is coated for easy wear detection.

#### Cutting data recommendations

#### **CB7025**

CB7025 is a unique, patented material (US 7670 980 B2) containing 60% CBN with a bimodal grain distribution ( $1\&3 \mu m$ ) in a ceramic binder. High fracture resistance makes it a very versatile grade for hard part turning. It has excellent tool life in interrupted cutting and is also recommended for mixed production and when there is some instability in machine setup.

#### Cutting data recommendations

							I = I	Recommer	nded :	starting value

#### **CB7525**

CB7525 is a very tough grade and contains 90% CBN with fine grains in a ceramic binder. It is designed for grey cast iron machining and also performs well in hard part turning applications in heavy interrupted cuts (short contact time) as well as in very abrasive steels (tool steels, manganese steels).

#### Cutting data recommendations

Cutting speed, v <sub>c</sub> m/min (ft/min)	50	(164)	100	(328)	150	(492)	200	(656)	250	(820)

							= Re	ecommend	led st	tarting value

#### **CB7925**

CB7925 contains 75% CBN in a ceramic binder. It has a bimodal CBN grain size distribution with a mix of large and fine CBN grains (4 & 12  $\mu$ m). The main application area is high alloy cast irons but this grade will also perform well in turning of hardened steel and cast iron rolls. CB7925 CBN inserts are only available in solid format.

#### Cutting data recommendations

Cutting speed, v <sub>c</sub> m/min (ft/min)	50	(164)	100 (328)	150 (492)	200	(656) 2	250	(820)

# Choose the right geometry

The insert geometry and edge preparation are extremely important in hard part turning as they have a significant influence on tool life and productivity. The Sandvik Coromant CBN product range includes inserts with standard nose radius, wipers and the unique Xcel design. The standard nose radius generates the lowest cutting forces and has the lowest stability requirements while wipers and Xcel give an unbeatable combination of high productivity and excellent surface finish.

## Standard nose radius

Insert nose radius is an important performance parameter:

- A small nose radius: 02, 04 mm (0.008-0.016 inch) provides good chip breaking.
- A large nose radius: 08, 12 mm (0.03-0.05 inch) generates better surface finish and produces thinner chips, which reduces the degree of crater wear in hard part turning operations.
- The combination of a large nose radius with small depth of cut results in reduced entry and exit forces.

In general, a large nose radius provides greater edge strength and therefore extended tool life. Use the largest nose radius allowed based on your process requirements.

## Wiper

The Sandvik Coromant patented wiper designs -WH and -WG are based on a number of blended radii and have been developed specifically for HPT. Wiper insets provide two possibilities for process improvement:

- · Improved surface finish with standard cutting data.
- Maintained surface finish at substantially higher feed rate.

## **Xcel**

The Xcel geometry has a straight cutting edge with a low entry angle. This produces thin chips and lower cutting temperatures, leading to reduced crater wear development. The benefits of Xcel are maximised when the entire cutting edge is used, so optimum performance is achieved on straight surfaces for one pass finishing at feed rate of 0.3 to 0.5 mm/r (0.012 to 0.02 inch/r). The maximum depth of cut is 0.25mm (.01 inch). It is possible to use eight cutting edges on an Xcel insert.

### Insert geometries

The measured surface qualities below give an indication of what geometry to choose under specific conditions.

Hardness = 58-62 HRC AP = 0,15 mm(0.0059 inch)  $v_{c} = 160 \text{ m/min}$ (525 ft/min)

#### 1. Radius

 $f_{n}=0.1 \text{ mm/r}$ (0.0039 inch/r) r= 0.8 mm/

(0.0315 inch)

#### Ra 0.433 µm in 0.000017 Rz 1.72 µm in 0.000068

#### Standard geometry

- · Lowest requirements on stability
- Lowest cutting forces
- · Normal surface finish vs. feed

## Why Hard Part **Turning?**

In the past, grinding was the common finishing process for hardened steel components. Today hard part turning is widely regarded as an efficient and cost effective alternative. Hard part turning can significantly boost productivity and at the same time deliver environmental benefits.

- High quality
- Reduced production time per component
- Process flexibility
- Lower machine investment costs
- Reduced energy requirements
- Coolant not required
- Easier swarf handling
- Possibility to recycle chips

#### 2. Wiper

- $f_{n} = 0.2 \text{ mm/r}$ (0.0079 inch/r) *r*= 0.8 + WH
- (0.0315 inch + WH)

#### Ra 0.391 µm in 0.000015 Rz 1.67 µm in 0.000066

#### WH geometry

- Versatile first choice
- Low cutting forces
- Low requirements on stability
- Improved surface finish vs. feed

3. Xcel<sup>™</sup>

 $f_n=0.5 \text{ mm/r}$ (0.0197 inch/r)

#### Ra 0.935 µm in 0.000037 Rz 4.60 µm in 0.000181

#### Xcel Very high stability requirements

Good surface finish at high feed rate

## **Choose the right edge** preparation

The combination of the nose radius and the edge preparation has a significant influence on tool life, surface finish and integrity of the machined part. It is very important to select the chamfer size and edge condition best suited to your application.

#### Edge condition

There are three edge conditions available in the Sandvik Coromant CBN range:

## Safe-Lok

The Safe-Lok tip on our negative inserts is a unique Sandvik Coromant concept. It provides a mechanical interlock in addition to brazing which gives additional strength and security in aggressive cutting conditions.

## **Chamfer angle and width**

In general, the strength of the cutting edge on CBN inserts increases with increasing chamfer angle and width, but also results in increased cutting forces and temperature.

A wide chamfer spreads the cutting forces over a larger area, which provides a more robust cutting edge, allowing for higher feed rates. Where process stability and consistent tool life are the most important factors, the best solution will be obtained using a large chamfer.

If surface finish and dimensional accuracy are the main requirements, a small chamfer will provide the best results. Cutting forces and temperature will be reduced and there will be less vibration. In some cases, where surface finish is critical, a honed edge (E-land) can be beneficial, even though the tool life will be shorter. Since hard part turning is usually employed as a finishing operation, it is necessary to find the optimum edge design which produces high quality components and a stable production process with good tool life.

## CoroTurn<sup>®</sup> TR

CoroTurn® TR provides a unique solution for high precision profiling of hardened steel components. The iLock interface ensures extremely secure and stable positioning of the insert in the seat. In this way, CoroTurn® TR eliminates micro-movement of the insert which can occur during profiling operations where the insert is subjected to multi-directional cutting forces when the tool path changes. CoroTurn® TR is available in CBN grades CB7015 and CB7025.

- · Maximum insert stability in the tool holder
- · Repeatable insert indexing
- · Closer tolerances and high quality surfaces
- Long, predictable tool life

## **Edge preparation guide**

## Edge Geometry Selection CB7015

## **Edge Geometry Selection CB7025**

Even more edge geometry options are available through our Tailor Made program.

## Edge Geometry Selection CB7525 (for ISO-H materials)

CB7525	Continuous	Medium interrupt	Heavy interrupt	
Negative			T01020 S01530	S02035 - First choice. S01530 - A strong edge when lower cutting forces are required. T01020 - Use for lowest cutting forces and to decrease vibration. First choice for cast iron.
		First choic		
Positive			T01020	S01030 - First choice. S01530 - A stronger cutting edge. T01020 - Use to reduce cutting forces and decrease vibration. First choice for cast iron.
		First choice	<b>S01030</b> S01530	

## **CBN in other insert families**

In addition to the general turning assortment our CBN range also includes inserts for parting and grooving, threading and small part machining available.

#### CoroCut® 1-2 System

CoroCut 1-2 is your first choice for parting, profiling and grooving. The system is based on a patented rail and V-shaped design which together with a long insert gives exceptional stability. This combination makes it possible to run at high cutting data and still achieve better productivity and close tolerances than any other system on the market. Use CoroCut inserts with -GE geometry for grooving and -RE for profiling. Insert widths available from 2.5 to 8.0 mm (0.1-0.3 inch) in grades CB7015 and CB20.

#### CoroThread ® 266

CoroThread<sup>®</sup> 266 delivers high precision threading performance. The unique iLock interface between the insert and the tip seat eliminates insert movement caused by cutting force vibration. Available in grade CB7015.

#### CoroTurn® XS

Precision inserts in small sizes, down to 7.0 mm (0.23 inch) for threading operations and 6.2 mm (0.24 inch) for grooving and threading. Its unique clamping system makes it reliable and easy to use. All CoroTurn XS grooving inserts produce grooves with flat bottom and sharp corner radii. Available in grade CB7015.

#### CoroCut® MB

CoroCut MB is a high-precision grooving, turning, and threading system for hole diameters from 10 mm (0.394 inch) and more. The edge line of the insert is sharp, and together with a thin-layered coating, it is suitable for internal machining. Available in grade CB7015.

## Success with CoroCut<sup>®</sup>

- Cutting data start values
- speed: 120m/min (390 ft/min)
- feed: 0.04mm/r (.0016 inch/r)
- Use coolant for long cutting times
- Use short tool overhang
- Use largest possible insert seat size

## **Prepare for success**

## Component design and preparation

Careful preparation of the component in the soft (unhardened) state will benefit the hard part turning process. Due to the relatively small depths of cut used in hard part turning, tight dimensional tolerances in soft machining are key to achieving a consistent process. This delivers longer tool life and high quality components. The use of features such as chamfers and radii on the component will optimise entry and exit paths for maximum tool life.

Points to remember when planning your soft machining conditions include:

- Avoid burrs
- Keep close dimensional tolerances
- Chamfer and make radii in the soft state
- Do not enter or leave cut abruptly
- Enter or leave by programming radius movements

## **Component Clamping**

Wide clamping jaws offer many benefits compared to ordinary three point jaws. This is particulary true for thin walled components which require extremely secure clamping.

The component should be as close as possible to the spindle bearings. As a general guideline, a length-to-diameter ratio of 2:1 is recommended for work-pieces supported on one end only, with acceptable maximum of 4:1. Where there is additional tailstock support, the ratio can be extended to 8:1. Correct alignment of the headstock and tailstock also adds to the rigidity of the setup.

## **Toolholder and insert clamping**

Use Coromant Capto for maximum stability. Alternatively, carbide bars are preferred to steel bars, because of their inherent stiffness. Use a rigid tool with a large cross-section and keep the overhang as short as possible. The security and stability provided by the CoroTurn® RC clamping system is recommended for CBN inserts.

## Wet or dry machining

Dry cutting is one of the key advantages of hard part turning. CBN inserts can tolerate cutting temperatures in excess of 1,000°C (1800°F). In general, the use of CBN in dry conditions has a positive effect on tool life, particularly in interrupted cutting.

Elimination of coolant:

- Reduces costs
- $\cdot\,$  Leads to easier chip handling
- · Is more environmentally friendly

However, there are some situations where coolant is required:

- $\cdot~$  To facilitate chip breaking
- $\cdot\;$  To control the thermal stability of the workpiece
- $\cdot\;$  To remove heat when machining big components

The coolant must always be applied as a consistent flow over the entire cutting length.

## One or two cut strategy

When deciding between a one- or a two cut strategy, these factors must be considered:

- Machine capability
- · What the most important process measures are.

It is very often a balance between accuracy and productivity.

#### One-cut strategy

With a high quality machine tool and a stable setup, a single cut can produce acceptable levels of surface quality and dimensional tolerance.

#### Two-cut strategy

When the machine setup is unstable, if there is any inconsistency in the component or if a very high final tolerance or surface quality is required, a two-cut strategy is likely to be the best option.

**One-cut strategy** 

Two-cut strategy

## **Tool wear**

In hard part turning the most common forms of CBN tool wear are crater and flank wear. The wear process depends on a number of factors:

- Workpiece material
- · CBN grade
- Cutting conditions
- Edge geometry
- Machine stability.

## **Crater wear**

Crater wear is dominant when machining case hardened steels and is mainly caused by chemical wear, due to the extremely high temperature and the forces at the contact point between the workpiece and the CBN insert. Crater wear development weakens the cutting edge which can lead to inconsistent tool life.

### Flank wear

Flank wear is more common at lower cutting speeds and when machining more abrasive steels such as bearing or tool steels. The primary wear mechanism is abrasion. Large flank wear has a negative effect on surface integrity and dimensional accuracy.

Even though wear is complex, there are ways to control it and maintain a consistent and reliable machining operation.

## **Troubleshooting recommendations**

Tool wear	Solution

#### To make life easier, a new standard is developed

### ISO 13399 is an international standard that will simplify the exchange of data for cutting tools. You will notice a slight difference, through the new parameters and descriptions of each tool.

For the first time ever, there is a standardized way of describing product data regarding cutting tools. When all tools in the industry share the same parameters and definitions, communicating tool information between software systems becomes very straightforward.

#### What does this mean to you?

Basically, it means that your systems can talk to ours, as they all speak the same language. Download product data from our web site and use it directly in your CAD/ CAM software to assemble tools that you use in production. No need to look for information in catalogues and interpret data from one system to another. Imagine how much time this will save you!
